On or about January 20, 1987, Plaintiff applied to the City of Rocky River for a building permit to construct a thirty (30) foot antenna system at his residence on Gibson Drive in Rocky River. On June 5, 1987, the Commissioner notified the Plaintiff in writing that his application for a building permit was denied based upon three grounds. First, the Plaintiff's proposed radio tower would exceed the maximum height allowance under section 1143.10(b) of the Codified Ordinances of the City of Rocky River. Section 1143.10(b) states in relevant part that:

> "broadcasting towers, radio... antennae... may be erected above the height limit for the district, subject to the following constraints:
>
> (1) The height from the base of such

> structure, or the uppermost point at which such structure is attached to a building, to the top of such structure shall not be greater than the horizontal distance from the base of the structure to the nearest adjoining property

---

(1)Specifically, as an amateur radio operator, Plaintiff claims violations of his rights under the Communications Act of 1934, 47 U.S.C. (sect.) 151, et seq., and the rules and regulations of the Federal Communications Commission ("FCC") promulgated thereunder, 47 C.F.R. , Part 97.

> line.
>
> Codified Ordinances of the City of Rocky River (sect.) 1143.10 (Ord. 59-73, Passed July 23, 1973) (1985).

In addition, the Commissioner stated that Plaintiff failed to provide certain technical information necessary to reviewing the permit application. Finally, the Commissioner stated that the proposed radio tower was not necessary for the development of Plaintiff's property and would result in a substantial impairment of neighboring real estate values, thus justifying denial of the permit pursuant to section 1333.02 of the Codified Ordinance of the City of Rocky River. Section 1333.02 states that:

> Whenever application is made for a permit to construct or alter a building or structure within this City, and the Building Commissioner finds that the proposed building or structure is of such value, design, material or location that it will result in a substantial impairment or destruction of value in neighboring real estate, and if he further finds that the use of the particular design, material or location proposed, or substantially similar ones, is not reasonably essential to the development of the property proposed to be built or altered, the

> Building Commissioner shall refuse to issue the permit. He shall within five days notify the applicant of such refusal and the reason thereof.
>
> Codified Ordinances of the City of Rocky River (sect.)1333.02 (Ord. 3077, passed November 14, 1955) (1985).

Plaintiff appealed this determination to the Board. On or about August 13, 1987, the Board approved the Commissioner's decision to refuse Plaintiff's application for a building permit.

^L

On or about August 27, 1987 Plaintiff appealed the Board's decision to the Cuyahoga County Court of Common Pleas, pursuant to Ohio Rev. Code Ann. (sect.) 2506.01 (Anderson 1981 & Supp. 1989).(2) See James D. Macmillan, et al. v. the City of Rocky River, Ohio, et al. , Case No. 135089. On or about October 6, 1987, Plaintiff filed a Motion for Enlargement of Time with the Cuyahoga County Court of Common Pleas, requesting an extension until October 27, 1987, to file a Brief in Support of his Appeal. On or about October 27, 1987, Plaintiff filed a Motion to Stay Proceedings in that Appeal. On November 9, 1987, Defendants filed a Brief in Opposition to Plaintiff's Motion to Stay Proceedings in the Court of Common Pleas. Apparently, Plaintiff has, to date, filed no brief in support of his appeal in the court of common pleas.

On October 27, 1987, the same day Plaintiff filed his motion to stay proceedings in the court of common pleas, Plaintiff also filed the complaint in the instant case in federal court.

The complaint alleges six claims against the City, the Commissioner and the Board:

---

(2) (sect.) 2506.01 states that:

> Every... decision of any... board... or any political subdivision of the state may be reviewed by the common pleas court of the county in which the principal office of the political subdivision is located...

Count I --- Sections 1331.01, 1333.02, and 1143.11(b) of the City Ordinances contravene federal law on their face and as applied to Plaintiff, thereby violating Art. VI (sect.) 2 of the United States Constitution.

Count II --- Sections 1331.01, 1333.02, and 1143.11(b) are unconstitutional on their face and as applied, in that they unreasonably burden radio communications and interstate commerce, thereby violating Art. I (sect.) 8.

Count III --- sections 1331.01, 1333.02, and 1143.11(b) are impermissibly vague and overbroad, thereby violating the First and Fourteenth Amendments. In addition, Defendants failure to promulgate reasonable rules relating to the grant of permits deprives Plaintiff of equal protection and due process, in violation of the Fourteenth Amendment.

Count IV --- Sections 1331.01, 1333.02, and 1143.11(b) are void and unconstitutional on their face and as applied insofar as they constitute an invalid exercise of state police power.

Count V --- sections 1331.01, 1333.02, and 1143.11(b) are void and unconstitutional on their face and as applied in that they deprive Plaintiff of equal protection in the exercise of his constitutional rights, guaranteed by the Fourteenth Amendment.

Count VI --- Defendant commissioner and Board members conspired to and did, under color of State law, deny plaintiff his constitutional right to a fair hearing and of his rights

^L

and privileges under the First and Fourteenth Amendments and by statute.

Plaintiff seeks declaratory and injunctive relief, as well as damages. The suit names as defendants the City of Rocky River, the Commissioner in his official and individual capacity, and the Board members in their official and individual capacities.

Defendants argue that the court should invoke the doctrine of abstention and decline to exercise jurisdiction. Alternatively, Defendants argue that Plaintiff's complaint should be dismissed in its entirety for failure to state a claim upon which relief can be granted, and/ or Defendants should be awarded summary judgement as a matter of law. Defendants also argue that the Commissioner and the Board members are protected from civil liability by qualified immunity, and therefore, the complaint against them in their individual capacity should be dismissed. Finally, Defendants argue that the Board members are not proper parties to the lawsuit, and thus, the court should dismiss all claims alleged against the members of the Board in their official capacity.

Plaintiff has moved for partial summary judgement on counts I and III.

II. ABSTENTION

The court finds no reason to abstain in the instant case. Noting that "[a]bstention from the exercise of federal

jurisdiction is the exception, not the rule," Colorado River Water Conservation Dist. v. United States, 424 U.S. 800, 813 (1976) and that absent "exceptional circumstances," County of Alleqheny v. Frank Mashuda Co. , 360 U.S. 185, 189 (1959), federal courts have "the virtually unflagging obligation.. . to exercise the jurisdiction given them, " Colorado River, 424 U.S. at 817, the Supreme Court has confined the circumstances appropriate for abstention to three general categories: (1) those that present "a federal constitutional issue which might be mooted or presented in a different posture by a state court determination of pertinent state law" ("Pullman" abstention) ; (2) those that present "difficult questions of state law bearing on policy problems of substantial public import whose importance transcends the result in the case then at bar" ("Burford" abstention) ; and, (3) those in which "absent bad faith, harassment, or patently invalid state statute, federal jurisdiction has been invoked for the purpose of restraining state criminal proceedings" ("Younqer" abstention). Colorado River, 424 U.S. at 815-816.

Defendants' brief argues that this court should abstain from ruling on Plaintiff's constitutional allegations under the Pullman line of cases. This argument, however, demonstrates a misunderstanding of the nature of that doctrine. Defendants claim that this court should withhold judgement until the Ohio courts have an opportunity to rule on the preemptive effect of the Federal Communications Commission's Memorandum Opinion and Order In the Matter of Federal Preemption of State and Local Regulations Pertaining to Amateur Radio Facilities, 50 Fed. Reg. 38813 (adopted September 16, 1985) (hereinafter referred to as "PRB-l").

While the preemptive effect of PRB-l will be discussed herein, it is enough to note at this time that preemption is not an unresolved question of state law of the type envisioned in the Pullman line of cases. Preemptive effect is, instead, a question of federal law, and thus, not a proper ground for Pullman abstention.

In addition, a federal court should only abstain under the Pullman doctrine where the state statute in question is uncertain. Babbitt v. United Farm Workers National Union, 442 U.S. 289, 306 (1979). In this instance, defendant has failed to indicate any way in which the relevant ordinances could be interpreted by Ohio state courts to avoid the constitutional questions raised in this action.

Burford abstention is also inappropriate in this case, as the state interest in local land use policy is insufficient to overcome the strong federal interest in promoting amateur radio operations. The Supreme Court stated in the Colorado river case that "the presence of a federal basis for jurisdiction may raise the level of justification needed for abstention." 424 U.S. at 815 n.2l. In issuing PRB-l, the FCC created "a limited preemption of state and local regulations which preclude amateur communications." 50

F.Reg. 38813. PRB-l states that:

> The ruling is necessary so that amateurs and local governing bodies alike will be aware of the strong federal interest in promoting amateur communication. The effect of the ruling is to give local communities and amateur operators a clear statement of the federal interest in amateur communications.
>
> Id. (emphasis added).

In addition, the ruling states that local ordinances "must be crafted to accommodate reasonably amateur communications" and to "represent the minimum practicable regulation to accomplish the local authority's legitimate purpose. " Id. at 38816. In light of this clear federal interest and the presence of at least partial preemption of local ordinances, it would be inappropriate for this court to abstain.

Several other federal courts have refused to abstain in cases similar to the one at hand. In Izzo v. Borough of River Edge, 843 F.2d 765 (3rd Cir. 1988), the plaintiff, an amateur radio operator licensed by the FCC, applied to the borough planning board for a variance to construct a forty foot transmission tower at his residence. After a hearing, the board denied the variance, and the applicant filed a complaint in district court alleging constitutional violations and an invalid exercise of the borough's police power. The court stated that while " [f]ederal courts have expressly disavowed any desire to sit as a statewide board of zoning appeals hearing challenges to actions of municipalities.. ., [t]he special circumstances here require that the district

^L

court retain jurisdiction and adjudicate its dispute." Id. at 769. Among those "special circumstances" was that "an express, narrow, and quite specific federal provision threatens, at most, only a minimal disruption of a broad state policy." Id. See also Bodony v. Incorporated Village of Sands Point, 681 F.Supp. 1009, 1014 (E.D.N.Y. 1987) (finding abstention in such cases "inappropriate").

Accordingly, abstention is not warranted in the instant case.

III. STANDARD OF REVIEW

Defendants argue that this action should be dismissed pursuant to Fed. R. Civ. Proc. l2(b) (6) for failure to state a claim upon which relief can be granted or alternatively that summary judgment should be granted. The court will treat Defendant's motion as one for summary judgment, as matters outside the pleadings are presented to and not excluded by the court. Fed. R. Civ. P. 12 (b). The granting of summary judgment is proper "if the pleadings, depositions, answers to interrogatories, and admissions on file, together with the affidavits, if any, show that there is no genuine issue as to any material fact and that the moving party is entitled to a judgment as a matter of law." Fed. R. Civ. P. 56(c) ; see Celotex Corp. v. Catrett, 477 U.S. 317 (1986). In considering the propriety of a motion for summary judgment, the court must view all facts and inferences in a light most favorable to the

^L

nonmoving party. Securities and Exchange Commission v. Blavin, 760 F.2d 706, 710 (6th Cir. 1985).

"The moving party has the burden of showing the absence of genuine disputes over facts which, under the substantive law governing the issue, might affect the outcome of the action." Harris v. Adams, 873 F.2d 929, 931 (6th Cir. 1989) (citing Anderson v. Liberty Lobby, Inc. ., 477 U.S. 242 (1986)). The nonmoving party, on the other hand, "is required to present some significant probative evidence which makes it necessary to resolve the parties' differing versions of the dispute at trial." 60 Ivy Street Corp. v. Alexander, 822 F.2d 1432, 1435 (6th Cir. 1987) (citing First Nat'l Bank of Arizona v. Cities Serv. Co., 391 U.S. 253, 288-89 (1968)). The nonmoving party must go beyond the pleadings "and by her own affidavits, or by the depositions, answers to interrogatories, and admissions on file, ' designate specific fact showing that there is a genuine issue for trial." Celotex Corp. , 477 U.S. at 324.

III. PRECLUSION

Plaintiff seeks summary judgement in this case on the ground that the local ordinances in question, both as written and applied, are preempted by PRB-l, and thus, may not be enforced without violating the Supremacy Clause of Article IV, section 2 of the United States Constitution. "Federal preemption is premised on the Supremacy Clause and

^L

manifestation of Congressional intent to exclude state law."

Bulchis v. City of Edmonds, 671 F. Supp. 1270, 1273 (W.D. Wash 1987) (citing Chicago & North Western Transportation Co. v. Kalo Brick & Tile Co., 450 U.S. 311, 317 (1981)). As "[f]ederal regulations have no less preemptive effect than federal statutes, " Fidelity Fed. Sav. & Loan Ass'n v. De La Cuesta, 458 U.S. 141, 153 (1982), the FCC has the power to preempt local ordinances which conflict with federal policies. The FCC issued PRB-l pursuant to its power to "make such rules and regulations, and issue such orders, not inconsistent with this chapter, as may be necessary in the execution of its functions. " 47 U.S.C. (sect.) 154(i).

It must be noted initially that this court need not even consider the possible preemption of (sect.) 1143.11(b), as it is the court's opinion that there is no violation of that ordinance as drafted. Where a "state's highest court has not spoken to the question in controversy, the federal court must discern how the state courts would respond if confronted with the question. " Hartford Fire Ins. Co. v. Lawrence, Dykes, Goodenberger, Bower & Clancy, 740 F.2d 1362, 1365 (6th Cir. 1984). Neither party has identified any instance in which the Supreme Court of Ohio has had the opportunity to interpret (sect.) 1143.11(b). Certainly, defendant has shown no state court support for the Commissioner's interpretation of the ordinance. See Deposition of Kevin Beirne, at 78-83. "Under Ohio law, " [i]t is a cardinal rule that a court must first

^L

look to the language of the statute itself to determine the legislative intent. ... If that inquiry reveals that the statute conveys a meaning which is clear, unequivocal and definite, at that point the interpretive effort is at an end and the statute must be applied accordingly. ' " Id. at 1365 (citing Provident Bank v. Wood, 36 Ohio St.2d 101, 105-06, 304 N.E.2d 378 (1973)).

The Sixth Circuit has also stated that in the absence of state authority, federal courts must be "guided by applicable principles of state law and by relevant decisions of other jurisdictions." Aims v. State Farm Fire & Casualty Co. , 731 F.2d 1245 (1984). The Supreme Court of Ohio has stated:

> This court has long held that statutes imposing restrictions on the use of private property must be strictly construed. ... All doubts should be resolved in favor of the free use of private property rather than in favor of restrictions on such use.
>
> Gennari v. Andres-Tucker Funeral Home, Inc. , 21 Ohio St. 3d 102, 488 N.E.2d 174, 177 (1986).

See also Pinnacle Woods Survival Game, Inc. v. Hambden Township Zoning Inspector, 33 Ohio App. 3d 139, 514 N.E.2d 906, 908 (1986) (stating that "[s]tatutes or ordinances which impose restrictions upon the use of private property will be strictly construed and their scope cannot be extended to include limitations not therein clearly proscribed") ; and Cicerella, Inc. v. Jerusalem Township Bd. of Zoning Appeals, 59 Ohio App. 2d 31, 392 N.E.2d 574, 577 (1978) (stating that "[i]n determining the permitted use of property under a zoning

^L

Classification in which terms and language therein are not otherwise defined, the common and ordinary meaning of these terms and language must be considered, liberally construing the terms and language in favor of the permitted use so as not to extend the restrictions to any limitation of use not therein clearly prescribed").

The plain language of the (sect.) 1143.11(b) allows for two methods of measuring antenna height. An antenna may either be measured from its base to its top, or from the uppermost point at which it is attached to a building to its top. As long as either of these measurements is shorter than the distance from the base of the antenna to the nearest adjoining property line , there is no violation of the ordinance. Plaintiff's thirty foot antenna will be attached to the building at a height of twelve feet and will be between twenty-seven and thirty feet from the nearest adjoining property line. Since there is no violation of the ordinance as drafted this court need not examine the question of preemption.

The court now turns to the possible preemption of (sect.) 1333.02.(3) In issuing PRB-l, the FCC attempted to reach an Accommodation between the federal interest in regulating amateur radio operators and the state interest in regulating

---

(3) The court will not consider plaintiff's challenge of (sect.)1331.01. Since plaintiff appealed the decision of the Commissioner, he was properly before the Board regardless of the filing of a protest under (sect.) 1331.01.

^L

land use. PRB-l describes the conflict as follows:

> Few matters coming before us present such a clear dichotomy of viewpoint as does the instant issue. The cities, counties, local communities and housing associations see an obligation to all of their citizens and try to address their concerns. This is accomplished through regulations, ordinances or covenants oriented toward the health, safety and general welfare of those they regulate. At the opposite pole are the individual amateur operators and their support groups who are troubled by local regulations which may inhibit the use of amateur stations or, in some instances ,totally preclude amateur communications.
>
> 50 Fed.Reg. at 38815.

PRB-l determines that a limited preemption policy is warranted, and states:

> Because amateur station communications are only as effective as the antennas employed, antenna height restrictions directly affect the effectiveness of amateur communications. Some amateur antenna configurations require more substantial installations than others if they are to provide the amateur operator with the communications that he/she desires to engage in. . .. We will not, however specify any particular height limitations below which a local government may not regulate, nor will we suggest the precise language that must be contained in local ordinances, such as mechanisms for special exceptions, variances, or conditional use permits. Nevertheless, local regulations which involve placement, screening, or height of antennas based on health, safety, or aesthetic considerations must be crafted to accommodate reasonably amateur communications, and to represent the minimum practicable regulation to accomplish the local

authority's legitimate purpose.

Id. at 38816.

The court concludes that (sect.) 1333.02 is not facially invalid since it provides a sufficient structure for balancing state and federal interests as required by PRB-l. By its

^L

terms the ordinance provides for a balancing of the effect of an improvement on neighboring property values against the reasonable need for the improvement to develop the property. As interpreted by Defendant, however, reasonable need in this situation involves reasonable need for the particular antenna to carry on effective communication of the type desired. See Defendant' Brief in Opposition to Plaintiff's Motion for Partial Summary Judgement, at 16. Interpreted as such, the ordinance could be applied to give reasonable consideration to both the city's local interests and Plaintiff's federally protected interest in amateur radio operation.

The court concludes, however, that the City of Rocky River did not apply the ordinance in such a way as to provide for the reasonable accommodation of amateur radio communications, and therefore, its ability to apply (sect.) 1333.02 as it did in this action is preempted by PRB-l.

It is only too clear from the depositions of Building commissioner Beirne and Gordon Stofer, a member of the Board of Zoning and Building Appeals, that neither the Commissioner, nor the Board had more than a cursory understanding of PRB-l and its requirements. Despite this, the City's actions might still be held legitimate if the decision making process included a reasonable accommodation of the federal government ' s interest in amateur radio communications. Evidence of such an accommodation, however, is totally lacking.

^L

The Commissioner's letter of June 5, 1987 denying Plaintiff's application for a building permit was largely conclusory. There was no indication in the letter that the Plaintiff's needs for adequate communication had been adequately considered. This combined with the Commissioner's obvious lack of understanding of radio communications at the time of his deposition indicates that concerns over property values and neighbors protests may have predominated in the decision making process.(4) The Board ' s verbal affirmance of the Commissioner's decision, unsupported as it is by any written opinion, fails to show any attempt to accommodate federal interests. Quite simply, there is nothing in the record to indicate that federal interests in amateur radio operation were sufficiently considered, or for that matter even adequately understood, by either the Commissioner or the Board.

Due to the court's holding on preemption, the plaintiff's second ground for summary judgement need not be considered.

---

[4] The third ground for the Commissioner's denial of a building permit was the Plaintiff's failure to submit certain technical documents. While the City of Rocky River clearly has the right to require applicants for building permits to submit all necessary technical documents, the Plaintiff has raised the point that the Commissioner's first mention of some of these documents was in the letter denying the permit. It is somewhat unclear from the record the extent to which the Plaintiff met the statutory requirement for a permit. It is unnecessary, however, for the court to reach this point, since the Board's verbal affirmance of the Commissioner's decision was based upon the effect of the antenna on property values and the Plaintiff's need for the antenna.

The only issue remaining is that of damages.

IV. DAMAGES

Defendant claims that due to the availability of qualified immunity all claims for damages against the Commissioner and members of the Board in their individual capacities should be dismissed. The Supreme Court of the United States has recognized that "permitting damages suits against government officials can entail substantial social costs, including the risk that fear of personal monetary liability and harassing litigation will unduly inhibit officials in the discharge of their duties." Anderson v. Creighton, 483 U.S. 635, 638 (1987). In light of this danger, he Court has "generally provid[ed] government officials performing discretionary functions with a qualified immunity, shielding them from civil damages liability as long as their actions could reasonably have been thought consistent with the rights they are alleged to have violated." Id. (citing Malley v. Briggs, 475 U.S. 335, 344-45 (1986), for the proposition that "qualified immunity protects all but the

plainly incompetent or those who knowingly violate the law ' ").

The applicability of qualified immunity turns on the "objective legal reasonableness" of the government official's action "assessed in light of the legal rules that were clearly established' at the time it was taken. " Id. (citations omitted). "On summary judgement, the judge appropriately may

^L

determine, not only the currently applicable law, but whether that law was clearly established at the time an action occurred. If the law at that time was not clearly established, an official could not reasonably be expected to anticipate subsequent legal developments, nor could he fairly be said to know' that the law forbade conduct not previously identified as unlawful." Harlow v. Fitzgerald, 457 U.S. 800, 818 (1982) (footnote omitted).

As noted previously, the case at hand turns largely on the extent to which PRB-l preempts enforcement of the local ordinances in question. While PRB-l indicated that local regulations "must be crafted to accommodate reasonably amateur communications, and to represent the minimum practicable regulation, " it also refused to "specify any particular height limitation below which a local government may not regulate" and declined to "suggest the precise language that must be contained in local ordinances." 50 Fed. Reg. at 38816.

In light of this vague language, the court holds that Plaintiff's rights under PRB-l were not sufficiently clear that a reasonable government official should have known that enforcement of the ordinances in question would be violative of those rights. The conduct of the Commissioner and the members of the Board is held to be objectively reasonable, thus entitling them to qualified immunity from damages.

Plaintiff is instructed to submit a brief within twenty days of the entry of this order detailing the grounds and

^L

Basis for any further claims for monetary damages. Defendant may respond within ten days thereafter.

IV. CONCLUSION

Accordingly, Defendant's motion for summary judgement is GRANTED to the extent that (sect.) 1333. 02 and 1143. 10 (b) are held to be facially valid, and the Commissioner and members of the Board are found to have qualified immunity from damages. Plaintiff's motion for summary judgement is GRANTED to the extent that the process employed by the City in denying his application to erect his antenna is declared invalid.

IT IS SO ORDERED.

UNITED STATES DISTRICT COURT

NORTHERN DISTRICT OF OHIO

EASTERN DIVISION

JAMES D. MacMILLAN,) 1:87,CV 2820
)
Plaintiff,)
)
- vs -) ORDER
)
CITY OF ROCKY RIVER, et al.,)
)
Defendants.)

Battisti, J.

Before the court is Defendants' Motion to Dismiss and/or for Summary Judgment. Also before the court is Plaintiff's Motion for Partial Summary Judgment on Counts I and III of his Complaint.

Plaintiff James D. MacMillan ("MacMillan"), an amateur radio operator, licensed by the Federal Communication Commission, brings this action against the City of Rocky River, the Building Commissioner for the City of Rocky River ("Commissioner"), in his individual and official capacities, and the members of the Board or Zoning and Building Appeals of the City of Rocky River ("Board"), individually and in their official capacities, for denying, pursuant to certain City ordinances, his application to construct a thirty foot radio antenna system at his Rocky River residence. MacMillan seeks a declaratory judgment, injunctive relief and damages, based upon alleged violations of his rights under the United States Constitution and relevant federal statutory law (1)

Jurisdiction in the federal district court is predicated upon these alleged violations of the United States Constitution and federal statutory law. 28 U.S.C. (sect.)(sect.) 1331, 1337 and 1343 (1982).

I. FACTS

On or about January 20, 1987, Plaintiff applied to the City of Rocky River for a building permit to construct a thirty (30) foot antenna system at his residence on Gibson Drive in Rocky River. On June 5, 1987, the Commissioner notified the Plaintiff in writing that his application for a building permit was denied based upon three grounds. First, the Plaintiff's proposed radio tower would exceed the maximum height allowance under section 1143.10(b) of the Codified Ordinances of the City of Rocky River. Section 1143.10(b) states in relevant part that:

> "broadcasting towers, radio... antennae... may be erected above the height limit for the district, subject to the following constraints:
>
> (1) The height from the base of such

> structure, or the uppermost point at which such structure is attached to a building, to the top of such structure shall not be greater than the horizontal distance from the base of the structure to the nearest adjoining property

---

(1)Specifically, as an amateur radio operator, Plaintiff claims violations of his rights under the Communications Act of 1934, 47 U.S.C. (sect.) 151, et seq., and the rules and regulations of the Federal Communications Commission ("FCC") promulgated thereunder, 47 C.F.R. , Part 97.

> line.
>
> Codified Ordinances of the City of Rocky River (sect.) 1143.10 (Ord. 59-73, Passed July 23, 1973) (1985).

In addition, the Commissioner stated that Plaintiff failed to provide certain technical information necessary to reviewing the permit application. Finally, the Commissioner stated that the proposed radio tower was not necessary for the development of Plaintiff's property and would result in a substantial impairment of neighboring real estate values, thus justifying denial of the permit pursuant to section 1333.02 of the Codified Ordinance of the City of Rocky River. Section 1333.02 states that:

> Whenever application is made for a permit to construct or alter a building or structure within this City, and the Building Commissioner finds that the proposed building or structure is of such value, design, material or location that it will result in a substantial impairment or destruction of value in neighboring real estate, and if he further finds that the use of the particular design, material or location proposed, or substantially similar ones, is not reasonably essential to the development of

> the property proposed to be built or altered, the Building Commissioner shall refuse to issue the permit. He shall within five days notify the applicant of such refusal and the reason thereof.
>
> Codified Ordinances of the City of Rocky River (sect.)1333.02 (Ord. 3077, passed November 14, 1955) (1985).

Plaintiff appealed this determination to the Board. On or about August 13, 1987, the Board approved the Commissioner's decision to refuse Plaintiff's application for a building permit.

On or about August 27, 1987 Plaintiff appealed the Board's decision to the Cuyahoga County Court of Common Pleas, pursuant to Ohio Rev. Code Ann. (sect.) 2506.01 (Anderson 1981 & Supp. 1989).(2) See James D. Macmillan, et al. v. the City of Rocky River, Ohio, et al. , Case No. 135089. On or about October 6, 1987, Plaintiff filed a Motion for Enlargement of Time with the Cuyahoga County Court of Common Pleas, requesting an extension until October 27, 1987, to file a Brief in Support of his Appeal. On or about October 27, 1987, Plaintiff filed a Motion to Stay Proceedings in that Appeal. On November 9, 1987, Defendants filed a Brief in Opposition to Plaintiff's Motion to Stay Proceedings in the Court of Common Pleas. Apparently, Plaintiff has, to date, filed no brief in support of his appeal in the court of common pleas.

On October 27, 1987, the same day Plaintiff filed his motion to stay proceedings in the court of common pleas, Plaintiff also filed the complaint in the instant case in federal court.

The complaint alleges six claims against the City, the Commissioner and the Board:

---

(2) (sect.) 2506.01 states that:

> Every... decision of any... board... or any political subdivision of the state may be reviewed by the common pleas court of the county in which the principal office of the political subdivision is located...

Count I --- Sections 1331.01, 1333.02, and 1143.11(b) of the City Ordinances contravene federal law on their face and as applied to Plaintiff, thereby violating Art. VI (sect.) 2 of the United States Constitution.

Count II --- Sections 1331.01, 1333.02, and 1143.11(b) are unconstitutional on their face and as applied, in that they unreasonably burden radio communications and interstate commerce, thereby violating Art. I (sect.) 8.

Count III --- sections 1331.01, 1333.02, and 1143.11(b) are impermissibly vague and overbroad, thereby violating the First and Fourteenth Amendments. In addition, Defendants failure to promulgate reasonable rules relating to the grant of permits deprives Plaintiff of equal protection and due process, in violation of the Fourteenth Amendment.

Count IV --- Sections 1331.01, 1333.02, and 1143.11(b) are void and unconstitutional on their face and as applied insofar as they constitute an invalid exercise of state police power.

Count V --- sections 1331.01, 1333.02, and 1143.11(b) are void and unconstitutional on their face and as applied in that they deprive Plaintiff of equal protection in the exercise of his constitutional rights, guaranteed by the Fourteenth Amendment.

Count VI --- Defendant commissioner and Board members conspired to and did, under color of State law, deny plaintiff his constitutional right to a fair hearing and of his rights and privileges under the First and Fourteenth Amendments and by statute.

Plaintiff seeks declaratory and injunctive relief, as well as damages. The suit names as defendants the City of Rocky River, the Commissioner in his official and individual capacity, and the Board members in their official and individual capacities.

Defendants argue that the court should invoke the doctrine of abstention and decline to exercise jurisdiction. Alternatively, Defendants argue that Plaintiff's complaint should be dismissed in its entirety for failure to state a claim upon which relief can be granted, and/ or Defendants should be awarded summary judgement as a matter of law. Defendants also argue that the Commissioner and the Board members are protected from civil liability by qualified immunity, and therefore, the complaint against them in their individual capacity should be dismissed. Finally, Defendants argue that the Board members are not proper parties to the lawsuit, and thus, the court should dismiss all claims alleged against the members of the Board in their official capacity.

Plaintiff has moved for partial summary judgement on counts I and III.

II. ABSTENTION

The court finds no reason to abstain in the instant case. Noting that "[a]bstention from the exercise of federal

jurisdiction is the exception, not the rule," Colorado River Water Conservation Dist. v. United States, 424 U.S. 800, 813 (1976) and that absent "exceptional circumstances," County of Alleqheny v. Frank Mashuda Co. , 360 U.S. 185, 189 (1959), federal courts have "the virtually unflagging obligation.. . to exercise the jurisdiction given them, " Colorado River, 424 U.S. at 817, the Supreme Court has confined the circumstances appropriate for abstention to three general categories: (1) those that present "a federal constitutional issue which might be mooted or presented in a different posture by a state court determination of pertinent state law" ("Pullman" abstention) ; (2) those that present "difficult questions of state law bearing on policy problems of substantial public import whose importance transcends the result in the case then at bar" ("Burford" abstention) ; and, (3) those in which "absent bad faith, harassment, or patently invalid state statute, federal jurisdiction has been invoked for the purpose of restraining state criminal proceedings" ("Younqer" abstention). Colorado River, 424 U.S. at 815-816.

Defendants' brief argues that this court should abstain from ruling on Plaintiff's constitutional allegations under the Pullman line of cases. This argument, however, demonstrates a misunderstanding of the nature of that doctrine. Defendants claim that this court should withhold judgement until the Ohio courts have an opportunity to rule on the preemptive effect of the Federal Communications

Commission's Memorandum Opinion and Order In the Matter of Federal Preemption of State and Local Regulations Pertaining to Amateur Radio Facilities, 50 Fed. Reg. 38813 (adopted September 16, 1985) (hereinafter referred to as "PRB-l").

While the preemptive effect of PRB-l will be discussed herein, it is enough to note at this time that preemption is not an unresolved question of state law of the type envisioned in the Pullman line of cases. Preemptive effect is, instead, a question of federal law, and thus, not a proper ground for Pullman abstention.

In addition, a federal court should only abstain under the Pullman doctrine where the state statute in question is uncertain. Babbitt v. United Farm Workers National Union, 442 U.S. 289, 306 (1979). In this instance, defendant has failed to indicate any way in which the relevant ordinances could be interpreted by Ohio state courts to avoid the constitutional questions raised in this action.

Burford abstention is also inappropriate in this case, as the state interest in local land use policy is insufficient to overcome the strong federal interest in promoting amateur radio operations. The Supreme Court stated in the Colorado river case that "the presence of a federal basis for jurisdiction may raise the level of justification needed for abstention." 424 U.S. at 815 n.2l. In issuing PRB-l, the FCC created "a limited preemption of state and local regulations which preclude amateur communications." 50 F.Reg. 38813. PRB-l states that:

> The ruling is necessary so that amateurs and local

> governing bodies alike will be aware of the strong federal interest in promoting amateur communication. The effect of the ruling is to give local communities and amateur operators a clear statement of the federal interest in amateur communications.
>
> Id. (emphasis added).

In addition, the ruling states that local ordinances "must be crafted to accommodate reasonably amateur communications" and to "represent the minimum practicable regulation to accomplish the local authority's legitimate purpose. " Id. at 38816. In light of this clear federal interest and the presence of at least partial preemption of local ordinances, it would be inappropriate for this court to abstain.

Several other federal courts have refused to abstain in cases similar to the one at hand. In Izzo v. Borough of River Edge, 843 F.2d 765 (3rd Cir. 1988), the plaintiff, an amateur radio operator licensed by the FCC, applied to the borough planning board for a variance to construct a forty foot transmission tower at his residence. After a hearing, the board denied the variance, and the applicant filed a complaint in district court alleging constitutional violations and an invalid exercise of the borough's police power. The court stated that while " [f]ederal courts have expressly disavowed any desire to sit as a statewide board of zoning appeals hearing challenges to actions of municipalities.. ., [t]he special circumstances here require that the district court retain jurisdiction and adjudicate its dispute." Id. at 769. Among those "special circumstances" was that "an express, narrow, and quite specific federal provision threatens, at most, only a minimal disruption of a broad state policy." Id. See also Bodony v. Incorporated Village of Sands Point, 681 F.Supp. 1009, 1014 (E.D.N.Y. 1987) (finding abstention in such cases "inappropriate").

Accordingly, abstention is not warranted in the instant case.

III. STANDARD OF REVIEW

Defendants argue that this action should be dismissed pursuant to Fed. R. Civ. Proc. l2(b) (6) for failure to state a claim upon which relief can be granted or alternatively that summary judgment should be granted. The court will treat Defendant's motion as one for summary judgment, as matters outside the pleadings are presented to and not excluded by the court. Fed. R. Civ. P. 12 (b). The granting of summary judgment is proper "if the pleadings, depositions, answers to interrogatories, and admissions on file, together with the affidavits, if any, show that there is no genuine issue as to any material fact and that the moving party is entitled to a judgment as a matter of law." Fed. R. Civ. P. 56(c) ; see Celotex Corp. v. Catrett, 477 U.S. 317 (1986). In considering the propriety of a motion for summary judgment, the court must view all facts and inferences in a light most favorable to the nonmoving party. Securities and Exchange Commission v. Blavin, 760 F.2d 706, 710 (6th Cir. 1985).

"The moving party has the burden of showing the absence of genuine disputes over facts which, under the substantive law governing the issue, might affect the outcome of the action." Harris v. Adams, 873 F.2d 929, 931 (6th Cir. 1989) (citing Anderson v. Liberty Lobby, Inc. ., 477 U.S. 242 (1986)). The nonmoving party, on the other hand, "is required to present some significant probative evidence which makes it necessary to resolve the parties' differing versions of the dispute at trial." 60 Ivy Street Corp. v. Alexander, 822 F.2d 1432, 1435 (6th Cir. 1987) (citing First Nat'l Bank of Arizona v. Cities Serv. Co., 391 U.S. 253, 288-89 (1968)). The nonmoving party must go beyond the pleadings "and by her own affidavits, or by the depositions, answers to interrogatories, and admissions on file, ' designate specific fact showing that there is a genuine issue for trial." Celotex Corp. , 477 U.S. at 324.

III. PRECLUSION

Plaintiff seeks summary judgement in this case on the ground that the local ordinances in question, both as written and applied, are preempted by PRB-l, and thus, may not be enforced without violating the Supremacy Clause of Article IV, section 2 of the United States Constitution. "Federal preemption is premised on the Supremacy Clause and

manifestation of Congressional intent to exclude state law." Bulchis v. City of Edmonds, 671 F. Supp. 1270, 1273 (W.D. Wash 1987) (citing Chicago & North Western Transportation Co. v. Kalo Brick & Tile Co., 450 U.S. 311, 317 (1981)). As "[f]ederal regulations have no less preemptive effect than federal statutes, " Fidelity Fed. Sav. & Loan Ass'n v. De La Cuesta, 458 U.S. 141, 153 (1982), the FCC has the power to preempt local ordinances which conflict with federal policies. The FCC issued PRB-l pursuant to its power to "make such rules and regulations, and issue such orders, not inconsistent with this chapter, as may be necessary in the execution of its functions. " 47 U.S.C. (sect.) 154(i).

It must be noted initially that this court need not even consider the possible preemption of (sect.) 1143.11(b), as it is the court's opinion that there is no violation of that ordinance as drafted. Where a "state's highest court has not spoken to the question in controversy, the federal court must discern how the state courts would respond if confronted with the question. " Hartford Fire Ins. Co. v. Lawrence, Dykes, Goodenberger, Bower & Clancy, 740 F.2d 1362, 1365 (6th Cir. 1984). Neither party has identified any instance in which the Supreme Court of Ohio has had the opportunity to interpret (sect.) 1143.11(b). Certainly, defendant has shown no state court support for the Commissioner's interpretation of the ordinance. See Deposition of Kevin Beirne, at 78-83. "Under Ohio law, " [i]t is a cardinal rule that a court must first

look to the language of the statute itself to determine the legislative intent. ... If that inquiry reveals that the statute conveys a meaning which is clear, unequivocal and definite, at that point the interpretive effort is at an end and the statute must be applied accordingly. ' " Id. at 1365 (citing Provident Bank v. Wood, 36 Ohio St.2d 101, 105-06, 304 N.E.2d 378 (1973)).

The Sixth Circuit has also stated that in the absence of state authority, federal courts must be "guided by applicable principles of state law and by relevant decisions of other jurisdictions." Aims v. State Farm Fire & Casualty Co. , 731 F.2d 1245 (1984). The Supreme Court of Ohio has stated:

> This court has long held that statutes imposing restrictions on the use of private property must be strictly construed. ... All doubts should be resolved in favor of the free use of private property rather than in favor of restrictions on such use.
>
> Gennari v. Andres-Tucker Funeral Home, Inc. , 21 Ohio St. 3d 102, 488 N.E.2d 174, 177 (1986).

See also Pinnacle Woods Survival Game, Inc. v. Hambden Township Zoning Inspector, 33 Ohio App. 3d 139, 514 N.E.2d 906, 908 (1986) (stating that "[s]tatutes or ordinances which impose restrictions upon the use of private property will be strictly construed and their scope cannot be extended to include limitations not therein clearly proscribed") ; and Cicerella, Inc. v. Jerusalem Township Bd. of Zoning Appeals, 59 Ohio App. 2d 31, 392 N.E.2d 574, 577 (1978) (stating that "[i]n determining the permitted use of property under a zoning

Classification in which terms and language therein are not otherwise defined, the common and ordinary meaning of these terms and language must be considered, liberally construing the terms and language in favor of the permitted use so as not to extend the restrictions to any limitation of use not therein clearly prescribed").

The plain language of the (sect.) 1143.11(b) allows for two methods of measuring antenna height. An antenna may either be measured from its base to its top, or from the uppermost point at which it is attached to a building to its top. As long as either of these measurements is shorter than the distance from the base of the antenna to the nearest adjoining property line , there is no violation of the ordinance. Plaintiff's thirty foot antenna will be attached to the building at a height of twelve feet and will be between twenty-seven and thirty feet from the nearest adjoining property line. Since there is no violation of the ordinance as drafted this court need not examine the question of preemption.

The court now turns to the possible preemption of (sect.) 1333.02.(3) In issuing PRB-l, the FCC attempted to reach an Accommodation between the federal interest in regulating amateur radio operators and the state interest in regulating

---

(3) The court will not consider plaintiff's challenge of (sect.)1331.01. Since plaintiff appealed the decision of the Commissioner, he was properly before the Board regardless of the filing of a protest under (sect.) 1331.01.

land use. PRB-l describes the conflict as follows:

> Few matters coming before us present such a clear dichotomy of viewpoint as does the instant issue. The cities, counties, local communities and housing associations see an obligation to all of their citizens and try to address their concerns. This is accomplished through regulations, ordinances or covenants oriented toward the health, safety and general welfare of those they regulate. At the opposite pole are the individual amateur operators and their support groups who are troubled by local regulations which may inhibit the use of amateur stations or, in some instances ,totally preclude amateur communications.
>
> 50 Fed.Reg. at 38815.

PRB-l determines that a limited preemption policy is warranted, and states:

> Because amateur station communications are only as effective as the antennas employed, antenna height restrictions directly affect the effectiveness of amateur communications. Some amateur antenna configurations require more substantial installations than others if they are to provide the

> amateur operator with the communications that he/she desires to engage in. . .. We will not, however specify any particular height limitations below which a local government may not regulate, nor will we suggest the precise language that must be contained in local ordinances, such as mechanisms for special exceptions, variances, or conditional use permits. Nevertheless, local regulations which involve placement, screening, or height of antennas based on health, safety, or aesthetic considerations must be crafted to accommodate reasonably amateur communications, and to represent the minimum practicable regulation to accomplish the local authority's legitimate purpose.

Id. at 38816.

The court concludes that (sect.) 1333.02 is not facially invalid since it provides a sufficient structure for balancing state and federal interests as required by PRB-l. By its

terms the ordinance provides for a balancing of the effect of an improvement on neighboring property values against the reasonable need for the improvement to develop the property. As interpreted by Defendant, however, reasonable need in this situation involves reasonable need for the particular antenna to carry on effective communication of the type desired. See Defendant' Brief in Opposition to Plaintiff's Motion for Partial Summary Judgement, at 16. Interpreted as such, the ordinance could be applied to give reasonable consideration to both the city's local interests and Plaintiff's federally protected interest in amateur radio operation.

The court concludes, however, that the City of Rocky River did not apply the ordinance in such a way as to provide for the reasonable accommodation of amateur radio communications, and therefore, its ability to apply (sect.) 1333.02 as it did in this action is preempted by PRB-l.

It is only too clear from the depositions of Building commissioner Beirne and Gordon Stofer, a member of the Board of Zoning and Building Appeals, that neither the Commissioner, nor the Board had more than a cursory understanding of PRB-l and its requirements. Despite this, the City's actions might still be held legitimate if the decision making process included a reasonable accommodation of the federal government ' s interest in amateur radio communications. Evidence of such an accommodation, however, is totally lacking.

The Commissioner's letter of June 5, 1987 denying Plaintiff's application for a building permit was largely conclusory. There was no indication in the letter that the Plaintiff's needs for adequate communication had been adequately considered. This combined with the Commissioner's obvious lack of understanding of radio communications at the time of his deposition indicates that concerns over property values and neighbors protests may have predominated in the decision making process.(4) The Board ' s verbal affirmance of the Commissioner's decision, unsupported as it is by any written opinion, fails to show any attempt to accommodate federal interests. Quite simply, there is nothing in the record to indicate that federal interests in amateur radio operation were sufficiently considered, or for that matter even adequately understood, by either the Commissioner or the Board.

Due to the court's holding on preemption, the plaintiff's second ground for summary judgement need not be considered.

---

[4] The third ground for the Commissioner's denial of a building permit was the Plaintiff's failure to submit certain technical documents. While the City of Rocky River clearly has the right to require applicants for building permits to submit all necessary technical documents, the Plaintiff has raised the point that the Commissioner's first mention of some of these documents was in the letter denying the permit. It is somewhat unclear from the record the extent to which the Plaintiff met the statutory requirement for a permit. It is unnecessary, however, for the court to reach this point, since the Board's verbal affirmance of the Commissioner's decision was based upon the effect of the antenna on property values and the Plaintiff's need for the antenna.

The only issue remaining is that of damages.

IV. DAMAGES

Defendant claims that due to the availability of qualified immunity all claims for damages against the Commissioner and members of the Board in their individual capacities should be dismissed. The Supreme Court of the

United States has recognized that "permitting damages suits against government officials can entail substantial social costs, including the risk that fear of personal monetary liability and harassing litigation will unduly inhibit officials in the discharge of their duties." Anderson v. Creighton, 483 U.S. 635, 638 (1987). In light of this danger, he Court has "generally provid[ed] government officials performing discretionary functions with a qualified immunity, shielding them from civil damages liability as long as their actions could reasonably have been thought consistent with the rights they are alleged to have violated." Id. (citing Malley v. Briggs, 475 U.S. 335, 344-45 (1986), for the proposition that "qualified immunity protects all but the plainly incompetent or those who knowingly violate the law ' ").

The applicability of qualified immunity turns on the "objective legal reasonableness" of the government official's action "assessed in light of the legal rules that were clearly established' at the time it was taken. " Id. (citations omitted). "On summary judgement, the judge appropriately may

determine, not only the currently applicable law, but whether that law was clearly established at the time an action occurred. If the law at that time was not clearly established, an official could not reasonably be expected to anticipate subsequent legal developments, nor could he fairly be said to know' that the law forbade conduct not previously identified as unlawful." Harlow v. Fitzgerald, 457 U.S. 800, 818 (1982) (footnote omitted).

As noted previously, the case at hand turns largely on the extent to which PRB-l preempts enforcement of the local ordinances in question. While PRB-l indicated that local regulations "must be crafted to accommodate reasonably amateur communications, and to represent the minimum practicable regulation, " it also refused to "specify any particular height limitation below which a local government may not regulate" and declined to "suggest the precise language that must be contained in local ordinances." 50 Fed. Reg. at 38816.

In light of this vague language, the court holds that Plaintiff's rights under PRB-l were not sufficiently clear that a reasonable government official should have known that enforcement of the ordinances in question would be violative of those rights. The conduct of the Commissioner and the members of the Board is held to be objectively reasonable, thus entitling them to qualified immunity from damages.

Plaintiff is instructed to submit a brief within twenty days of the entry of this order detailing the grounds and

Basis for any further claims for monetary damages. Defendant may respond within ten days thereafter.

IV. CONCLUSION

Accordingly, Defendant's motion for summary judgement is GRANTED to the extent that (sect.) 1333. 02 and 1143. 10 (b) are held to be facially valid, and the Commissioner and members of the Board are found to have qualified immunity from damages. Plaintiff's motion for summary judgement is GRANTED to the extent that the process employed by the City in denying his application to erect his antenna is declared invalid.

IT IS SO ORDERED.

FILED NOV 13 PM 4:39
CLERK U.S. DISTRICT COURT
NORTHERN OHIO DISTRICT
CLEVELAND

UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF OHIO
EASTERN DIVISION

JAMES D. MACMILLAN,) 1:87 CV 2820
)
Plaintiff,)
)
vs -) ORDER
)
CITY OF ROCKY RIVER, et al.,) -----
)
Defendants.)

Battisti, J.

On September 21, 1990, an order was issued addressing the parties cross motions for summary judgment in the instant case. The court ruled that the Rocky River municipal ordinances in question were facially valid, but as applied were preempted by PRB-1, an FCC regulation. In so ruling, the court declined to reach the constitutional issues raised by the Plaintiff, James D. MacMillan. Plaintiff was left to seek his amateur radio antenna permit under the codified Rocky River procedures, and Defendants were instructed that future decision making in this area must include "a reasonable accommodation of the federal government's interest in amateur communications," as expressed in PRB-1.

With the issue of the ordinances' validity addressed, all that remained for consideration was the plaintiff's request for damages. Accordingly, the parties were requested to brief any remaining claims for damages. (1)

Since Plaintiff's subsequent brief raised only the issue of attorneys fees under 42 U.S.C. sec. 1988, the court assumes that this is the only issue remaining for disposition.

Section 1988 states, in pertinent part:

> In any section or proceeding to enforce a provision of sections 1981, 1982, 1983, 1985, and 1986 of this title, title IX of Public Law 92-318, or title VI of the Civil Rights Act of 1964, the court, in its discretion, may allow the prevailing party, other than the United States, a reasonable attorney's fee as part of the costs.

The Plaintiff claims that although the court did not rule on any of his constitutional claims, he is entitled to attorney's fees as discussed in Maher V. Gagne, 448 U.S. 122, 130-32 (1980).

Although Maher explores the intended scope of sec. 1988, Seaway Drive-In, Inc. v. Township of Clay, 791 F.2d 447 (6th Cir.1986), cert. denied 479 U.S. 884 (1987), is more relevant to the present inquiry. Seaway Drive-In explains the Sixth Circuit's application of Maher, as well as, the Supreme Court's later holdings in Smith v. Robinson, 468 U.S. 992 (1984), and Hensley v. Eckerhart, 461 U.S. 424 (1983).

In Seaway Drive-In, the Plaintiff challenged a town ordinance that regulated drive-ins. 791 F.2d at 449. A preliminary injunction and eventual consent decree were based upon state law claims, obviating the need for the district court to consider the plaintiff's constitutional challenges Id. The district court declined to award the sec. 1988 attorney's fees and the court of appeals reversed. Id. at 455. Seaway Drive-In is analogous to the instant case in which the court did not reach the Plaintiff's constitutional challenges due to the presence of a dispositive non-fee claim.

---

(1) The court has held that the Defendants were entitled to qualified immunity with regard to the claims against them in their individual capacity.

The Seaway Drive-In court began its analysis by citing the following passage from Maher.

> The legislative history [of sec. 1988] makes it clear that Congress intended fees to be awarded where a pendant constitutional claim is involved, even if the statutory claim on which the plaintiff prevailed is one for which fees cannot be awarded under the act. The report of the Committee on the Judiciary of the House of Representatives accompanying H.R. 15460, a bill substantially identical to the Senate bill that was finally enacted, stated:
>
>> To the extent a plaintiff joins a claim under one of the statutes enumerated in H.R. 15460 with a claim that does not allow attorney fees, that plaintiff, if it prevails on the non-fee claim, is entitled to a determination on the other claim for the purpose of awarding fees.
>>
>> Morales v. Haines,486 F.2d 880 (7th Cir. 1973). In some instances, however,the claim with fees may involve a constitutional question which the courts are reluctant to resolve if the non-constitutional claim is dispositive.
>>
>> Hagens v. Lavine, 415 U.S. 528 [94 S.Ct. 1372, 39 L.Ed.2d] (1974). In such cases, if the claim for which fees may be awarded meets the 'substantiality' test, see Hagans v. Lavine, supra; United Mine Workers v Gibbs, 383 U.S. 715 [86 S.Ct. 1130, 16 L.Ed.2d 218] (1966), attorney's fees may be allowed even though the court declines to enter judgment for the plaintiff on that claim, so long as the plaintiff prevails on the non-fee claim arising out of a 'common nucleus of operative fact.' United Mine Workers v. Gibbs, supra, at 725 [86 S.Ct. at 1138]. H.R.Rep. No. 94-1558, p. 4, n. 7 (1976).

448 U.S. at 132, n. 15 (cited at 791 F.2d at 451). The court equated the test laid out in the legislative

history -- i.e. the requirements that the fee claim be substantial and that the fee and non-fee claims arise out of a common nucleus of operative -- with that used to determine whether a court has pendent jurisdiction over state law claims. Seaway Drive-In, 791 F.2d at 452. In addition, it held that the district court had erred in basing its substantiality determination on whether the fee claims could survive a motion for summary judgment at the time of the consent decree. Id. Under the proper substantiality test, a claim is only "insubstantial if it is `obviously without merit' or if `its unsoundness so clearly results from the previous decisions of [the Supreme Court] as to foreclose the subject and leave no room for the inference that the question sought to be raised can be the subject of controversy, '" Id. (Citing Hagans, 415 U.S. at 537).(2)

Based upon the sixth Circuit's construction of the Maher test, this court finds that Plaintiff's constitutional claims were both substantial and arising out of a nucleus of

---

(2) Further the court stated that " [t]he claim must be `so insubstantial, implausible, foreclosed by prior decisions of [the Supreme Court] or otherwise completely devoid of merit as not to involve a federal controversy within the jurisdiction of the District Court, whatever may be the ultimate resolution of the federal issues on the merits.' " Seaway Drive-In, Inc. v. Township of Clay, 791 F.2d 447, 452 (6th Cir. 1986), cert. denied 479 U.S. 884 (1987), (citing Hagans v. Lavine, 415 U.S. 528, 543 (1974)).

operative fact common to both the fee and non-fee claims.(3)

Finally, the Defendants make the unfounded claim that the plaintiff is not a prevailing party. The plaintiff is considered to have prevailed if there is "some actual benefit to the plaintiff either in terms of monetary damages, injunctive relief or a voluntary change in defendant's conduct. " Wooldridge v Marlene Industries Corp., 898 F.2d 1169, 1174 (6th Cir. 1990).

Plaintiff's claims all involved a challenge to the review process to which he was subjected. The court determined that the process was flawed, but only reached

---

(3) The Defendants raise Smith v. Robinson, 468 U.S. 992 (1984), as a basis for denying attorney's fees. The Sixth Circuit addressed both Smith and Hensley v. Eckerhart, 461 U.S. 424 (1983), in Seaway Drive-In, Inc. v. Township of Clay, 791 F.2d 447, 453-55 (6th Cir. 1986), cert. denied 479 U.S.

884 (1987).

Smith involved plaintiff seeking district court review of an adverse agency ruling on numerous non-fee grounds. The only fee claim was a due process attack on the administrative proceedings themselves. The due process claim sought only to prevent further state hearings under the challenged regulation. The Court's holding, therefore, that a fee award was inappropriate was based on the fact that "the due process claim and the substantive claim on which plaintiffs ultimately prevailed involved entirely separate legal theories and, more important, would have warranted entirely different relief. " Smith, 468 U.S. at 1015.

The Sixth circuit viewed Hensley as reaching a similar holding. "Hensley makes clear that the purpose of the 'relationship between the claims' element or the fees award test is to prevent the award of fees in those cases where the fees and non-fee claims ar aimed at achieving different results or where they are based on different facts and different legal theories." Seaway Drive-In, 791 F.2d at 455.

Neither of these cases is analogous to the instant case. The constitutional claims in this case arose from the same local review process. In addition, the relief available in each was substantially similar.

Plaintiff'spreemption claim. plaintiff has, therefore, succeeded in obtaining a new hearing in which the federal interest in amateur radio operation is to be seriously considered. This should lead to a hearing process which is substantially different from plaintiff's last hearing.

Defendants make the alarming allegation that the new review "is consistent with and is not a material alteration of previous consideration of PRB-l by ROCKY RIVER. " This statement is followed by a Citations to the transcript of the prior review which indicates that PRB-l and technical data were submitted for consideration. The Defendants ought not to think that they will comply with this court's order by merely going through the motions or denying Mr. MacMillan another permit. Any decision to disregard the federal interest raised in PRB-l must be based upon substantial justification end explained in the record. Defendants should keep in mind that after this litigation it may be more difficult to support a claim for qualified immunity if they once again fail to sufficiently consider the federal interests involved.

Plaintiff's motion for sec. 1988 attorney's fees is GRANTED. Plaintiff is instructed to submit a reasonable accounting of his fees in this case within thirty days of the issuance of this order.

IT IS SO ORDERED.

Frank J. Battisti.
United States District Judge

All this endless debate about CW is getting pointless. Amateur radio will not change one way or the other whether there is a CW requirement or not. What has changed it, almost beyond recognition, is the near-extinction of home building of equipment. When I was first licensed in 1963, most hams I knew had built at least one major piece of equipment. My interest was primarily in designing and building electronic gear, and my interest in the communications side was limited to testing out the things I had built, and discussing the technicalities with others. As the hobby got more and more oriented to appliance operators I soon found there was nobody to talk to any more, and finally in 1981 I let my license lapse, though I was last on the air in 1977.

Towards the end, even attempting a QSO became an unpleasant experience, with the growth of channelization, FM and repeaters (which IMHO do not have anything to do with the true spirit of Amateur Radio) on 2 meters and I found my SSB signal decidedly unwanted. When the same thing started happening to 70cm, I decided to quit.

Today's appliance operators totally miss the joy of communicating with somebody using the fruits of one's own endeavor. I will never forget the first time I went on 2 meters using a receiver and transmitter built entirely out of parts recovered from scrap TVs - 1 watt of AM, but it worked! 70cm and 23cm soon followed, then SSB, RTTY and TV. None of the equiment I ever used was factory built for amateur use. Most was home built and the rest was heavily modified military surplus.

What I'd really like to see is some licensing incentive to use homebrew equipment. Perhaps choice frequencies where commercial equipment is banned (but how would you enforce it?) Or a new grade of license to get which you had to show competence in design and construction of a useful piece of ham equipment.

Anybody else have any suggestions?

Incorrect? That depends upon the objective. First of all, making
these radials longer than a 1/4 wave will introduce reactance
and generally screw up the radiation pattern.
Would you advocate making a dipole with one side longer than
the other?

Drooping the radials and adding to their length will raise the
impedance of the vertical from approx. 37 ohms.
The downside is a higher takeoff angle--which seems to me to
be counter-productive, particularly since the SWR caused by
a 37 ohm load on 50 ohm coax is trivial. (Another instance
of the obsession so many hams have with SWR, carried to the
point of shooting themselves in the foot).

Actually, with only 4 tuned radials, a plot of the vertical
angle radiation of this antenna will look like a scalloped
candy dish, with the best (i.e. lowest) angle occurring
over each radial. Ideally, one would want a solid disk,
but it can be approached quite closely by attaching a
circular peripheral wire to the ends of the radials.

This is why top hats on shortened verticals, so treated,
have to be only half the diameter to achieve the same
capacitance effect.

>
>I'd love to hear anything that you all may have to say on this.

This is almost an impossible question to answer as it is down to a
matter of personal preference. I would recommend starting cheap but
with something that will have a good resale value. The reason is that
at present you do not know what you want from a rig & you need time
to make up your mind. Taking the cheap option will not give you
the best performance but it will certainly teach you about what to
look for in your next rig. I would also add that simplicity is
essential. All the bells & whistles on modern rigs are enough to
make even the most hardened technocrat squirm!

If you were in the UK I would advise you to visit your local emporium
and try the equipment (ours are usually very helpful) and join
your local club - the members may even let you try their station. I
don't know if its the same over there but its worth a try.

I started with a Heath SB101 (similar to the Yaesu 101). It was
a very basic rig that would tx & rx but had no frills (not even RIT).
It sure taught me and when I went to buy my current rig (now 8 years old)
I knew just what I wanted from it and hence the decision was only
between the equipment that came up to that mark. BTW rig is FT102 and
I have **no** plans to change it.

Hope this helps.
73,
John

Of note is the TI applications books are good, but as I see it (I
reference them on ocassion), they are showing good examples, but
without some background that may be necessary. This is, of
course, mathematically based. Also, some of the math is there,
but may be without an explanation close by. Of course, my view is
biased, because I have a slight weakness in math (but I am trying
to recover).

Ok, Some will find this hard to believe but here it goes.

I used to get mad when my mic cord got twisted, till i found out why.

They get kinky and twisted when you twist them. People are creatures of habit and by picking up the mike, talking, and putting it back down the same way every time, some of us will undoubtedly put a twist in the cord each time. when this reaches a certain point there appears a reverse turn in the coil. I have learned to watch how I pick up/ put down my mic and no longer have this problem.

Of course I don't pick up a mic that often and don't have to deal with such trivial annoiances as kinky cords because I'm a CW op. I suppose the rest of you inferior non-cw types would never be able to unkink your cords (or anything else for that matter) with out members of our super-race around.
:-) :-) :-) :-) :-) :-) :-) :-) :-) :-) :-) :-) :-) :-) :-) :-) :-) :-)

Any one out there know of iny scrap yards that might have electronic parts in Wilmington, DE. I am most interested in power transformers, and capaciters. A place where old TVs go to die would do verry well.

I am also interested in any information about catgalogues that contain specification data for PLL chips and other RF ICs. This documentation is very hard to find here in Wilmington.

I say ASSININE because it will have little or no effect for what they think.

Actually, it has a great effect, that of removing from a position in the HAM radio structure where they and their negative attitude could have far-reaching impact (very negative in my opinion) on new HAMs coming into the hobby.

I know a LOT of people on both sides of the issue. I personally am in favor of what the FCC has done, but I have 2 friends who are VERY adamant about being against it, even in the original ARRL proposal. But even now, we all agree that the damage is NOT from what the FCC has done, or even what the proposed new HAMs may or may not do, but from the people who will not accept what has been done, and by their actions could polarize a whole new infux of individuals against the existing individuals.

It may take time, but eventually the new techs will be a major force in HAM radio. They may take YEARS to get to doeble digit percentages. I personally feel that there will be a major influx, then a steady stream so that in 5 years there will be at LEAST 10% of the HAM ranks that got into it with the no-code entry. To try to brand these people as outsiders is ASSININE!!! I'll say it again, ASSININE!!!! If this is treated right, I see a LOT of the new no-code techs viewing HF as an ENHANCEMENT to their license, not as the place of refuge of the old farts who fought their entry. Play this up as positive, and there will be positive entry of these new techs into HF and advanced licenses. Play this as negative, and it will start a 'turf war' that eventually by sheer numbers the HF will be taken over by people who feel it is "us" vs "them", and they will push through and dominate HAM radio, with an attitude you may not like.

I like what the FCC has done just fine. With any luck, this move will relieve some of the HF crowding.

For a brief discussion that explains both the contributions of Uda
(the main inventor) and Yagi (the coauthor), see Kraus, "Antennas",
second edition.  Actually, the first edition probably has it too;
but all I have is the second.

Please help..

The other night as I was "twisting the knobs" I got to thinking that my 10
years was about up since I got my Advanced ticket. Draging out my license
I was horrified to find my ticket expired in July of 1987. After picking myself
up off the floor I started to find out what I needed to do. A few calls
to friends
did not help, so the next day I went to the local ham store (50 miles away)
They told me I was past the 2 year grace period and would have to retest,
starting at novice. They then sold me $27 dollars worth of books, including
"THE FCC Rule Book" by the ARRL (8th edition, copyright 1989).

After some reading in the above FCC Rule Book I found in chapter 4 page 4-6

License Terms

"Licenses are normally good for ten years. If you have a license
good for the old
five-year term" (mine was) ", a grace period of five years is
allowed should you
forget to renew. After two years of the grace period has passed, you
will lose your
call sign and will be assigned a new one.
If you have a new 10-year-term license" (mine was not) ", issued
since January
1984, the grace period for reinststement is two years."

I then looked in the back of the book where part 97 is printed and found
no mention
of the 5 year grace period for 5 year licenses. It only talked said
renewal may be made
during a 2 year grace period.

Does anyone know who I can call to find out for sure. I don't want to
apply for renewal

and wait for 3 months to find out from the FCC that I have to retest.

ANY IDEAS?
PLEASE.

As items concerning ICOM have been posted to the net (like complaints or customer service anecdotes) I have been passing them on to Bill Everett, K7RIE of ICOM. I can't recall Bill's job there, but he is a higher up manager in their Bellevue facility.

Bill is not on usenet, but has a Compuserve address that is accessable from the net. For a long time Bill was unable to reply to usenet messages, but the kinks seem to have been worked out.

For anyone who has a problem with any ICOM product or service that they feel they have been unable to resolve otherwise, or if you would just like to bend Bill's ear concerning just about anything, his email address is:

This depends more than a little, I believe, on whether or not the radials
do indeed "droop." A quarter-wave vertical antenna works just fine against
an *infinite* ground plane, if said plane is flat and orthogonal to the
radiating element. So any length in excess of 1/4 wavelength should work,
and we see that ground-mounted verticals require no radials whatsoever,
assuming that the local ground (in the sense of the earth itself) is good
enough. However, once the "ground plane" starts to "droop away" from the
end of the vertical element, the thing starts to look less and less like the
theoretical 1/4-wave vertical, and more and more like a half-wave dipole.
Think of the radials drooping from 90 deg. to the vertical down to 0 deg. (in
line with the vertical element); as this "droop" progresses, the feedpoint
impedance will increase from the vertical's 37 ohms up to the dipole's 73,
and the length of the "bottom element" (the radials, which all come together
when you get to zero degrees) becomes more and more critical. Obviously,
it damn well better be 1/4-wave when you get to zero and the thing becomes
a vertical dipole!

By the way, a ground-mounted vertical is an excellent long distance antenna
because of the "infinite" ground plane; the radiation pattern is that of

a dipole on end, meaning that the strongest radiation is a zero degrees from horizontal - straight out to the horizon! The higher the frequency, though, the more difficult it is to make sure that a ground-mounted antenna isn't swallowed up in local clutter.

I wouldn't mind if store employees ADMITTED it when they don't know something. I went to buy a telephone answering machine recently (Good Guys, I think) and was informed by the salesman that the machine operates on a frequency of 49 kHz. I heard another salesman tell someone else that no one can listen into their brand of cordless phone because of its digitally-encoded ringer.

   Non-acidic silicone can be got at your local aquarium supply store.
Just don't have a heart attack when you see the price. There are also
"advanced" car repair-gasket silicones that are non-acidic.
Apparently this is required for continued health of oxygen sensors....
       - Jerry Kaidor

Another good way to keep out the weather is "COAX SEAL", which is
sold at your local Radio Shack....

Humph. Rules, yes. Numbers, no. I trust more an operator who knows where to look when in unfamiliar territory, than one who memorizes frequencies, modes, and power limits and trusts their memory.

I'd like all those silly frequency and mode questions to be replaced with ones like: How wide is a typical 2-meter voice channel width? (15KHz) Where do you look to find the current legal (FCC) band allocations and power limits? Where do you look to find the conventions for band plans?

As with CW, my experience in recently becoming a ham was that I had to memorize a lot of information I rapidly lost, due to lack of use. The time would have been better spent learning theory and practice, getting a "feel" for certain things.

> the code?

1. It was a requirement to get a license, even if they didn't want or need to use it. Disability learning it ==> no license.

2. Because it's possible to be a happy ham without using or remembering the code, knowing it was irrelevant (except for passing the now obsolete code test) to many prospective hams.

Amazing. This sounds like convergent evolution!

Perhaps one could make money selling "pre-kinked" mike and phone cords.

Seriously, I wish I had a solution too. It's another example of consumerism, I guess. It only has to look good to sell, not to use.

| users have the cellular phone, CB, and commercial two way. Our charter is
+---------------

You both missed a point I made earlier in the message. Simply put, one need not necessarily have to wield a soldering iron to be "technologically proficient"; in fact, for such things as public service and emergency communications, technological proficiency lies in knowing how to best make use of radio "appliances", ham or otherwise, to facilitate efficient communications (who's going to homebrew radios on the spot to provide communications during a public event?).

There are many ways to "understand" radio technology, and all of them are relevant to ham radio and to society, and all are useful. But all of them are currently out of style, along with the many forms of understanding of the many other technologies that are used every day.

+---------------
| society. Most people take utilities for granted and have little curiosity

I'm thinking about SETI in reverse:

Suppose aliens were able to receive our RF. Further suppose that aliens advanced enough to find our RF are also smart enough to triangulate on our planet. Suppose they had the means to use this information for the purpose of military invasion. Further suppose that they've already suppressed their own RF emissions after realizing the possibility of this scenario.

My point is that SETI will only find cultures like our own. The more primitive ones will not have developed RF transmitters, and the more advanced ones will have suppressed their inter-planetary radiations. It's a small window - maybe only 200 years for each culture.

As quoted from <34245.2787533D@stjhmc.fidonet.org> by ddodell@stjhmc.fidonet.org (David Dodell):

+---------------
| I would like to bring the lead of my packet setup (RG-8U) through the window
| at my home on a semi-permenant basis. However my wife, is leary of leaving
+---------------

People with full-size patio doors have a similar problem even if they don't leave the doors unlatched/open. The usual solution is to cut a piece of wood (3/4" dowel rod, for example) to the size that just fits between the sliding part of the door and the doorframe. A similar trick is often used with windows.

In your case, you would close the window against the coax (remember not to close it too tightly, or you may affect the impedance of the coax!) and cut the dowel to fit that. You may also want to cut another piece to fit vertically to block the gap left above (or below) the coax... especially if your area likes to get cold, as it does here in NE Ohio. This is basically what I did to run cable outside my apartment to the antennas; landlords are even less happy about people drilling holes in walls than wives are.

I agree with Randall Rhea about Radio Shack bashing. I've used RS stuff frequently, and I usually get what I pay for. When I go there, I know what I want and don't need to have the stuff explained to me. If I want high quality stuff and knowledgeable salespeople, I find other sources.

I've traded at RS for many years under this philosophy, and haven't been disappointed yet.

ddodell@stjhmc.fidonet.org (David Dodell) writes:

> However my wife, [...] is not thrilled on having me drill holes
> through the wall.

After our house was on the market for a long time, and I got tired of having to live my life to please a lot of people I didn't know, I came up with this solution. My windows are Casement windows, that is they crank out and are a rectangle with the long sides vertical. The window consists of a movable pane and a fixed pane. I went outside, and removed the screws holding the fixed pane and its frame to the window casement (their Anderson Windows BTW) I then replaced the window section with a sandwich of two pieces of 1/2 inch marine plywood, with foam insulation between the sheets. There was a little room, which I filled by drilling a small hole on the inside piece, and shooting in that Great Stuff Foam. I then applied a bead of silicone sealant to the joint between the window casement and the outside piece of plywood. A few minutes with a paint brush and the same paint as the rest of the trim, and I now have a piece of the house that I can drill through, and my XYL doesn't mind. I use the wall tubes that Radio Shack sells, and after the coax is run through I shoot in some more great stuff to keep the cold and little friends from entering the house.

I works just fine, and the room is actually warmer because the section I added has a much higher R Value than the glass -- This is Minnesota, land of 10,000 degrees below zero, you know. When I want the window back, its just remove 4 screws, put back the the glass part with 4 screws, and a little dab of silicon sealant, and TADA! a civilian window.

BTW I do not have any connection with the brands of home repair products, its just what my local home store carries.

You can not get this stuff at yer local ironmongers. But electronic supply houses - the places that sell manufacturers their rolls of solder, liters of flux etc. Check the yellow pages or call the purchasing agent at a nearby electronics factory.

There are tons of different Silicone compounds used in the electronics biz. Some are used for semiconductor manufacturing, some for conformal coating etc. But you need the stuff that is the same as regular RTV but lacks the Acetic Acid. This stuff is called "Dow Corning Silastic 738 RTV non-corrosive adhesive/sealant".

This stuff takes longer to cure than the regular stuff.

D. Robert Spexet II (spexet@ux.acs.umn.edu) asks:

>Which rigs ... would be good ones for a beginning ham? ... I myself
>am interested in any comments that you people may have on Icom's 725,
>726, and 735 models.

My mother, JR1MNI, has an Icom IC-725 (the one without 6 meter coverage). The only problem she has had with it was parasitic oscillation, which she cured with a bunch of toroidal cores. The IC-725 is a reasonably priced, reliable, easy to use HF transceiver. I can vouch for the transmitting audio; she sounds just like herself on the SM-10 microphone. Very clean signal, too.

I use an IC-760 at my club station. The IC-725 is, in some areas, actually easier to use than the more expensive IC-760. The IC-725 has what Icom calls "band stacking registers" -- this means if you change bands, say from 10 meters to 15 meters, and you change back, say to 10 meters again, you get the same frequency you were using last time you were on that band. The IC-760 always goes to a particular frequency on the band. So you can tell that more expensive machines aren't always nicer. (Icom fixed this problem in their upgraded IC-765.)

The major drawback of the IC-725 and other entry level transceivers is lack of filters. If you are into contesting or chasing rare stations, then you will probably want filters to reduce QRM. High quality filters are not necessary at all for casual rag-chewing; so long as you go to a sparsely populated section of the band (in my case, the high end of 15 meters), there's no QRM to worry about in the first place, so there's no need for filters. As a matter of fact, since filters distort the audio and never really get rid of interference anyway, it's a much better idea to escape the crowd and settle down in a quiet spot if you can.

Other shortcomings include lack of speech processor (which I have vowed never to use again after a deeply embarrassing incident), lack of internal CW keyer (but you can buy these for around $50), lack of internal power supply, and an array of optional equipment that you would like to have but adds to the overall price. The power supply and other options are something you should consider. Take the IC-725. You need a 13.8 VDC power supply capable of somewhere over 22 A. You probably want to provide power to other equipment, so you buy a power supply with a 30 A rating, maybe. That adds to the price. And so does the AM transmit and FM transceive circuit board (10 meter FM is a lot of fun) and a narrow CW filter (a must for easy copy). All this stuff is included in more expensive rigs, so when you really compare prices, the overall difference isn't as large as you might think. Entry level transceivers are still cheaper, however, and make good sense to buy.

If you are primarily interested in 6 meters and you want HF coverage as an option, the IC-726 may not be a good choice as other rigs. The IC-726 has lower power on 6 meters than it does below 10 meters. You may want to consider the Yaesu FT-650 that covers 12 thru 6 meters. I would not buy the Kenwood TS-680, because as far as 6 meter operation goes it is basically the same as the Icom IC-726, and the IC-726 is much easier to use.

My final word on this issue is this: compared to entry level transceivers, expensive rigs are better on receive, but more or less the same on transmit. Microphones make more difference on transmit than does the rig itself.

He did ask. The difficulty with getting on the net has to do with economics. Specifically, we can't afford to install a full-up LAN to communicate internally. But I'm working on putting together a low-cost homebrew LAN which will make it a bit easier.

Right now, we have a four-station LAN running and have a mail gateway (via uucp) to the University of Hartford. You can send mail to the following individuals via this mechanism:

Jon Bloom, KE3Z   jbloom@arrlhq.UUCP
   Laboratory Supervisor

Ed Hare, KA1CV   ehare@arrlhq.UUCP
   Laboratory Engineer

Dave Newkirk, WJ1Z dnewkirk@arrlhq.UUCP
   QST Assistant Technical Editor

Rus Healy, NJ2L   rhealy@arrlhq.UUCP
   QST Assistant Technical Editor

At present, these are the ONLY people who can receive mail via this route. We anticipate expanding the LAN in the near future, and I'll keep the net posted. At present, only email is supported--the LAN users can't read or post to rec.ham-radio. I hope to support news soon too.

You can continue to use 2155052@mcimail.com to send mail to others at ARRL HQ.

You are correct.

The Technician is not (and cannot be) the control operator of the 2m/10m repeater, but s/he can transmit on the 2m side.

For what its worth:

I saw a note posted on the local Packet Cluster last night. It stated that YA0RR was moving to a new QTH closer to the Russian border and it would take 1 to 3 days to get back on the air. It said it was hoped this would make for a smoother operation, even though he it being protected? by the army (doesn't sound too good to me). He may still have to use the indoor dipole at the new QTH.

Not sure if this is any better than the rest or the rumors.

Good hunting,

Jay K0GU

>screen bypassing components.

The great advantage of this approach, from Eimac's point of view, is that it sells a lot of tubes. Modern power tetrodes can't tolerate even momentary excess screen current. Some method of near instantly opening the screen circuit is essential to the survival of these tubes. Even overcurrent relays are often too slow to save the tube. Also, if you lose plate voltage for even an instant before dropping screen voltage while the tube is under drive, bye bye tube. The best circuits I've seen for screen protection use a programmable switching supply with very small capacitors that is turned on and off by system controls including overcurrent sensing and power sequencing. Even this is tricky because some power tetrodes normally run with a slight negative screen grid current so your supply needs to be able to serve as either a sink or source of current while maintaining a stiff screen voltage.

The simplest circuit derives screen voltage from the plate supply via a high value dropping resistor that doubles as a current limiter, with a shunt regulator, either gas or solid state, that sets the screen voltage. This is practically fool proof. If the regulator fails though, you'd better have good plate overcurrent protection too. Of couse the plate circuit can stand a lot more overloading before causing permanent damage to the tube so a dropout relay or even a fast fuse will do nicely. You can TR the amplifier by grounding the screen, a very good, fast method of TR. I've had a pair of 8890s running in this circuit for a couple of years with no problems.

Stuff about how FIR filters work, and mention about software deleted.

The art of DSP does require some mathematics to understand. I have several references, some heavy with the mathematics (you could say they OOZE the stuff), and others are easier to get. Some are texts, some are applications notes. These are some of my favorites.

PC-DSP, by Otkay Alkin, Prentice-Hall, ISBN# 0-13-654450-9, includes a floppy disk, most likely a 3.5" IBM for this ISBN. Special ordered from the local University bookstore, $21. This is software used in some DSP courses around the U. S. It will, given your specification, aid in designing most of the filters I have seen mentioned in the literature .

Digital Signal Processing in VLSI, by Richard J. Higgins, Prentice-Hall, ISBN# 0-13-212887-X, available from your local Analog Devices rep, $38, though our rep is good to me and gave me mine. Analog Devices also publishes or copublishes several good references on analog electronics as well.

Discrete Time Signal Processing, by Alan V. Oppenheim and Ronald W. Schafer, Prentice-Hall, ISBN# 0-13-216292-X, also special ordered from the local University bookstore, $56. This is an update and amplification of the classic Digital Signal Processing by the same authors, which has been used as a University text and reference since 1975. Includes some new info that is mentioned often in some of the trade rags (EDN, Electronic Design, etc.). This book is very heavy mathematically, so beware.

TI has three applications books, available for a phone call at (800) 336-5236, extension 3528. Some of the math is discussed, but may be a little higher level. Routines for the TI TMS320 series processors is also given.

Motorola has also published some applications notes, pointed at their DSP56000 series processors. Our local rep provided a set to everyone at a recent day long seminar. In a couple of these

books, digital filters are designed from analog prototypes, which
may help several people who may have analog design experience.

ARR (Advanced Receiver Research) seels some very high quality
receiving converters for VHF. Unfortunately, they don't also
manufacture companion transmitting converters.

Does anyone know of commercially-available VHF transmitting
converter, either in the USA or imported?

If your license was issued less than 10 years ago it is still valid.
Some text was accidentally left out of the revised Part 97 and you may
have just found an instance of this. The FCC's intent was not to change
any license terms when they issued the revision.

I would like to build my own QRP-tranciever (or possible TX+RX) and I want
some construction advices.

I've read W1FB fine QRP notebook, and something in ARRL handbook, but
what I would like to have is a 40m-dedicated tranciever with 5W PEP and
a SWR/Wattmeter that shows 0-5 W in .1W steps... And an antenna-tuner..

Where do I find constructions for this? In QST? PLEASE tell me # and vol.

Will QRP ARCI have more information for me?

What does "The Joy of QRP" mainly contain? Can it be ordered via ARRL?

If someone has a HW-9-description to sell I will also be interested, but I
think it is too heavy for me.

What I'm looking for is a very-light-weight 1-band-only QRP-TRX that can
be carried while trekking in the Swedish mountains/Lappland.

Thanks.

Any reading suggestions in Radio Communication or QST will be appreciated..

Thanks,

Magnus SM7TUS

Dan, haven't you noticed that the more advanced a civilization gets, the more restrictive is regulations become. Any highly evolved extra-terrestrial hams out there are going to have CCNR's, power restrictions, and band limitations that make ours look like freedom. The only mode they may be able to get out with is CW. So if you really want a chance for some ET QSO's you had better get that new Bencher key you have been drooling over! B--)

I just purchased a TS-940S last summer, and I just recently noticed
something strange about the VBT variable bandpass control in the cw mode.
When I turn the control fully CCW to the narrow position, I loose all
signals. At least, the signals are at least -60 db down at that point.
If I stay clock wise of the 12 oclock position the vbt works fine.
When I turn the vbt control to the most counter clockwise (narrow) position,
I seem to completely loose all signals. Is this normal for ALL TS-940's,
or does mine have a problem?

Also, when I switch in the kenwood narrow 500 Hz cw filter, the cw signals
are attenuated about 6db. Is this normal.
Any comments or suggestions would be greatly appreciated.

I talked to the VEC at ARRL and he told me I could renew my license but
would lose my call sign. I then called the Consumer Assistance Branch of
the FCC (717-337-1212) and was told the same thing (and they
were very friendly and polite also!!!) . The 5 year license has a 5
year grace
period the 10 year has a 2 year grace period.

PLEASE CHECK YOUR LICENSE NOW!!!!
Thanks to all

I heard from JA1NUT this morning that the REAL YA0RR finally showed up this morning sometime after 0400Z (7 January) on 10 CW. Sin said he bagged it, and the JA's were having an easy time edging the Euros out. The rumor floating around the west coast--attributed to VK9NS--is that they're only running 30 watts into an indoor antenna. Have any of you east coast people spotted them yet? Our best guess here is that the window is going to be 0230Z to at most 0430Z, probably on 20. At least, that's where all of our UI and UJ spots have been for the last couple of weeks. But there wasn't a trace of them last night. Any respectable rumors would be appreciated. I've been glued to 14020 for a week now, and even the slims and pirates seem to be getting worn down!

```
All together now:  .._  .__.   .._ .__.  where's he listening?   .._  .__.
                   what's his call?   .._ .__.   burrrrrp!

This isn't much help, but I seem to recall that Michigan Bell just shut down a BBS system using similar logic. They seem to be the most aggressive in this area. All of us that use our phones for multiple purposes need to watch this very carefully. I have 4 phone lines into my house, Voice, FAX, my modem and the XYL's modem. They are all for personal use and I would hate to see the phone company start charging business rates.

>Is it OK to just connect each amplifier's B+, B-,
>and chassis grounds together?  Actually, the real question is
>what will happen to cathode-current metering?

I've built the 2KV supply, with grid and screen supplies for a multiple
4CX250B HF amplifier.  My strategy is to connect B-, chassis, and
electrical ground together.  I'm using some sockets that allow me to
insert metering resistors between the chassis and cathode.  Keep the
metering resistor and bypass cap leads short if you're doing VHF.  I
drive the plate and screen transformer from the same point, so plate is
guaranteed whenever screen is available.  (Thanks for the tip, Gary, I
think I'll just let the main fuse do the work, and not fuse B+)
```

>I gotta admit, triodes in grounded-grid baffle me.

You and me both. After reading the ARRL Handbook's 4CX250B 2m amplifier
article, it appears the GG's biggest advantage is that it lowers stage
gain, making self-oscillation less likely. With careful design, you can
use common-cathode, and get outrageous power gains. I've taken up the
gauntlet and chosen the latter.

From a mathematical standpoint, DSP is simpler than analog design, since the former requires only series expansions, while the latter really requires calculus. So, if you want to become proficient in DSP, break out that old precalc textbook, and look over series expansions.

Good thinking! The issue is destined to take care of itself. Now, to more
serious matters: Best way to keep curly-cords to retain their "shape" is to
not exercise them :)   Don't stretch 'em and don't let 'em hang down. Yeah,
I know; then why have one? Well, so you can stretch 'em I guess. Anyway, the
question was asked, and there's my answer.

A recent article with this subject mentions the PK-232 and new AEA DSP product. I just purchased a PK-232 (as an alternative to the M7000) and was not aware of the forecoming DSP products. I also wanted to keep the system at a reasonable cost. I have a couple of questions:

- Is there a way to Better the PK-232. Specially in RTTY with the 170/200 Hz filter problem. I would like to keep the ability to have 200Hz filters for packet. May be some tuning, a switched capacitor/resistor or altogether a better external modem ...

- The AEA DSP being out of my financial range (for now) do you know of a product (kit/circuit design/commercial) that could allow me to do DSP on my laptop (no slot inside). An A/D converter between the audio and the RS-232 of the PC may be enough. I would write the softwar including FFTs. I wrote software for an EEG on the PC. Displaying brain waves or radio waves should be pretty close in theory (program wise that is).

- You mention good results using discone antennas. I am curious. I have an ICOM R7000 and a discone, the local satellite shop told me NO WAY, I think they are just trying to sell me their equipment. What is your opinion concerning whether or not I can get satellites with my equipment.

Sorry if the tone struck you wrong (that's a problem with this medium!), but this really was meant to be an 'inquiring minds' kind of question, and not a flame of any sort. I admit to never having peered under the hood of a PSK-1, and therefore rashly assuming that it was more or less a direct copy of the TAPR modem (a la TNC-2 clone). This assumption was evidently off-base, and I thank you for clarifying the issue.

Having homebrewed a PSK modem from the original Japanese design, I can attest that it is an excellent performer, even without the value-added goodies that came later. In the early days of FO-12 mode JD, it ran rings around the other folks, who were all using G3RUH modems.

Barry

HT Antenna question....

Does anyone have experience with the AEA Hot-Rod antenna for 440 MHz?
Is it as good as the HR-1 is for 2M? I have an HR-1 and have been very
happy with it. I also have a Diamond RH-77 dual band flexible antenna which
words very well on my Kenwood TH-77A dual-band HT, but I'm looking for a
little more gain on 440.

Any help with 440 MHz HT antennas would be helpful. (I never use a duck)

Ok, I got a reply from David Sumner, K1ZZ saying that it was ok to post
his reply. So, here it is (unedited except for removal of some extra mail
headers!). I present it without comment (at this point, anyway :-)

First, my mail:

From rusty Wed Jan 2 09:03:08 1991
Subject: No-code license as proposed by FCC
To: syntllct!uunet!mcimail.com!0002155052
Date: Wed, 2 Jan 91 9:03:08 MST
Cc: syntllct!uunet!mcimail.com!0002184001 (wy5i),
     syntllct!uunet!mcimail.com!0003511297

Dear ARRL,

Last year I let my membership to the ARRL expire. I had been planning
to renew until I heard that the ARRL will be petitioning the FCC to
not allow the new no-code Technician class licensee priveledges below
220 MHz. Part of the reason I originally allowed my membership to expire
was the ARRL's no-code position.

I strongly object to your opposition to the FCC's decision. I will
continue to be a non-member of the ARRL should you insist upon the
folly of opposing their decision.

For the record, I am Carroll D. Carruth, Jr., N7IKQ, technician class
licensee for approximately 4 years. If you desire, you may reply to me
via email (using your current email interface's "reply" command), or
via postal service at 245 W. 10th Place, Mesa Arizona 85201.

Thank you very much for your attention to this matter.

Carroll D. (Rusty) Carruth, Jr.
245 W. 10th Place #6
Mesa AZ 25201

Dear Rusty:

I appreciate your MCI message, because it gives me the opportunity to correct some false information that appears to be circulating.

The truth is this: ARRL HAS NOT DECIDED TO PETITION FOR RECONSIDERATION OF ANY PORTION OF DOCKET 90-55.

The only statement that has been made by the League that has made any reference whatsoever to possible reconsideration was released by President Larry Price, W4RA, on December 14. He said, "Before we can decide whether to request that the Commission partially reconsider its action, we'll have to see the Report and Order." (The R&O was not released until the 27th.) In the same statement, he asked League members to share their views with their elected Directors, who collectively determine League policy.

The ARRL Board of Directors will be holding its regular meeting on January 18-19. I anticipate that between now and then, the Directors will be reviewing the input they receive from members. At the meeting, the Board may or may not consider the subject, and if it does, may or may not vote to seek reconsideration. No one can say for certain at this point: it depends on what a majority of Directors decide at that time.

League members have an opportunity to select their own elected representatives to the Board, and also have the opportunity to influence the opinions of their Directors on any issue. You sound like the sort of radio amateur who would want to take advantage of both of these opportunities.

I am forwarding your message, and this reply, to the Director of the Southwestern Division: Fried Heyn, WA6WZO.

73,

David Sumner, K1ZZ
Executive Vice President

I have two questions - not related:

1) I'd like to meet some more Swedish speakers in North America. A fews contacts have been made - and will continue to be made - on a couple Swedish nets. But, in one case I met a Swede who has been a Ham in the US for more than 30 years, but he found the net for the first time in that morning I met him.

Jag skulle garna hora av dig!

2) Getting basic info on paket radio has not been intuitive or easy. I live in a area where I know of two Hams using paket. I haven't met them yet so Hams or Paket clubs are not at hand. The articles in QST, while informative, are sporadic in its presentations on what I'd like to read about. I've ordered both ARRL's "Gateway to PR" and the RTTY Journal so this info will be forthcoming. But, in the several weeks I've been on this list, I've heard practically nothing about paket radio. Let me know of other LISTSERVers on paket radio, other newsletters or national organizations that zero-in on this field (digital communications).

Bob:
I appreciate the feedback you have provided and the insight you have
given in regards to the design and improvements to the original
TAPR design.

Open discussions like this are, I feel, invaluable in helping
understand and sort out the technical tradeoffs for products like
this. As one of the design engineers, your comments and feedback
have been very valuable to me in deciding which way to go.

Thanks for ALL of the information yo have shared!

Wrong, wrong, wrong, wrong, wrong. There was a HUGE discussion going on
about this one that lasted through at least December of 1990.
Entitled something to the effect of "Bruce Willis and Amateur Radio"
along with a "Die Hard" thread as well.
It is generally accepted as a USENET QUASI-FACT that the HTs in "DH" were
Kenwood TH25 HTs (or something along that series).... or should I say USED FOR
SHOOTING THE FILM!!!! The things these HTs did were... shal we suffice to
say.... slightly unrealistic... Transmitting on either the national
police emergency coordination frequency (well, OK no one specified what
frequency during the film, but lets assume that Bruce, being a cop from
NYC would know the LAPD frequencies would say "hey they should be monitoring
here!" ..no I don't remember the frequency..it is VHF hi-band.. BOB PARNASS
save me!) for talking with Reginald Veljohnson (the cop on the ground who
shot a kid once) or CB channel9 (with the 'ordering a pizza' line)
which is not NBFM...(notice I did not say GMRS)
Best part: The radios were full-duplex!! (what realism! :-)
Then our happy USENET family discussed the intracacies of the RED x-mit LED
on the HT for a couple more weeks... (Well, at least I did READ it all!)
..
During DIE HARDER the hts were purported (by the storyline) to have some sort
of whiz-bang digital transmission mode... or by some interpretations, an
encoded type of frequency access scheme and/or x-mit/rcve CTCSS locking
squelch. Where the user must punch in the secret code in order to access
either the frequency (or the key for the digital transmission algorythm,
depending on your interpretation of the story... It has been a while.. maybe
I'll rent it again tonight.) However, there is a brief shot where when Bruce
discovers an HT with the code enabled (what luck!) where you can clearly see
"TH-45" on the HT (I know, I said "Hey thats a 440 Kenwood HT" and my date
got mad, and told me I was a radio geek for the rest of the night)
However, for those who enjoy suspending disbelief for movies, I will admit
that they did put some sort of red/green authorization status light on the
HT. Additionally, when the army was called in they brought in "all sorts of
radio gear"... which looked exactly like a TS-940 and SM-220, tranceiver and
station monitor (there was even a nice lissajous figure on the SM-220, during
receive...imagine that!!)
...
Enough nitpicking....WHAT!! NEVER ENOUGH NITPICKING!!!!!
...
Lets fry-up some no-code techs for dinner, shall we? :-)   <-BIG :-)!!

OK OK OK... I am losing it.
But on the serious side and for a complete non-sequitor, is any one
doing a lot a 12meters (or any WARC for that matter) recently...
24Megs was hot today in the northeast, YCCC had more spots for
12m than 15m by a factor of 2 (and good ones like ZS9)
Also, does anyone have praises/horror-stories about the Mosley 5-banders?

Looks like I got confused by the fact that they're always called "remote
bases" even when they aren't really remote bases according to Part 97.

As quoted from <7880396@hpfcdc.HP.COM> by ajs@hpfcdc.HP.COM (Alan Silverstein):
+---------------
| > HAM RADIO IS UNPOPULAR BECAUSE UNDERSTANDING TECHNOLOGY IS UNPOPULAR.
|
| Consider automobiles.  In their early years, you pretty much had to be a
| mechanic to own one.  Nowadays, due to successful "consumer packaging",
| total idiots (in more ways than just auto mechanics) can drive cars.
+---------------

Yes, but what happens when there are no more auto mechanics, because nobody
wants to learn how?  I'm not saying *everyone* must become technologically
knlwdgeable, but the U.S. at least is fast headed toward a point where we
will be dependent on Asia for our technology because nobody here understands
it any more.

| Does anyone have a phone number or email address I could use to get an
| answer directly from the FCC on this matter ????
+---------------

General rule of thumb: let the experts ask the FCC. Preferably someone with legal knowledge. However you may feel about the ARRL, I'd ask them first --- you might also direct your query to the various VEC's and see what they say, as they may well have given the matter consideration.

I heard back from the horse himself. [:-)

He went as far as he could (since he said it) to give the impression that he didn't REALLY say it. I think that HQ has realized they goofed and are trying to back away from the news release statement in order to minimize the lashback from codefree techs in the area of QST subscriptions. (Sorry, I meant ARRL dues.)

I forwarded your letter to the Fidonet FCC conference. Some middle level FCC
employees and a communications lawyer who practices before the FCC show up
there regularly. If I get an answer from them, I'll fetch it back here.

Can anyone suggest a nice radio for working either the 10 meter or 2 meter bands. I have been looking at Yaesu, Icom, and Kenwood, but I can't decide which one out of the brand names I want to buy. Any Responses will be appresciated.

=========
SpaceNews
=========

MONDAY JANUARY 7, 1991

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* U2MIR NEWS *

==============
Musa, U2MIR, (aka UV3AM when at home in Moscow) despite his rigorous work schedule has been QRV on 145.55 or thereabouts usually in the 1200 - 1300 UTC time frame. He reports that Mission Commander Victor, U9MIR, will be sharing the station with Musa as time permits.

It appears that Amateur Radio is rapidly becoming a part of normal operations on MIR. It is reported that the next crew (expected to be launched in May 1991) may have another ham or two on-board. Boris Stepanov, UW3AX, the RSF "Ham in Space" project coordinator indicates that training courses for prospective MIR cosmonauts are presently being coordinated.

UA6HZ is handling QSLs for both U2MIR and U9MIR. The address is:
Valery Agabekov, UA6HZ, Box 1, 375600 Yessentuki, USSR. Use of this address should obtain a faster turnaround than through Box 88 Moscow.

AREM Status:

The equipment for the Austrian Amateur Radio Experiment on MIR (AREMIR) is nearing completion. In a telephone interview for the South African Radio League program "Amateur Radio Mirror" the President of AMSAT-OE, Wolf Hoeller (OE7FJT), said that integration of the equipment is nearing completion. The packet radio station consists of a TNC2 and a two meter hand-held transceiver built into a "black" box with connectors for the antenna and laptop computer.

He told Hans van de Groenendaal (ZS6AKV) that the TNC and radio will be delivered to Moscow by mid January for a month of testing. The equipment will be sent to MIR during early March. Originally, it was announced that the equipment was to be launched in mid January, however it appears that delays in final check-out has slipped the launch date a few months.

For the first few months AREMIR will operate as a Packet radio beacon. During a later supply mission, a laptop computer will be sent to MIR which will allow the cosmonauts to enter messages. Wolf, OE7FTJ, said that there is some doubt whether the laptop computer will survive the shake test. It may well have to be taken up by an Austrian Cosmonaut due to be sent to MIR towards the end of September or in early October, 1991.

[Information via AMSAT, Wolf (OE7FTJ), Boris Stepanov (UW3AX), Ray Soifer (W2RS), and Hans van de Groenendaal (ZS6AKV)]

* SHUTTLE NEWS *
================
The Space Shuttle "Discovery" was powered up last week in preparation for mission STS-39 (DoD) currently scheduled for launch in March. Installation of the Forward Reaction Control System was carried out and a high pressure main propulsion test was also performed.

Atlantis is being prepared for launch in April. The remote manipulator "arm" that will be used in the deployment of the Gamma Ray Observatory during its mission was prepared for installation last week.

Our VE group has not had any instructions on the situation yet; seems as
though someone holding cscs for 2 and 3A will be rather easily
processed into new Techs.

As for "

"busiest VE session ;in NNJ" ??!!??

and as for your comment about "How to Call FCC"   ******DONT EVEN THINK OF DOING THAT *******

That's the way adverse rulings are generated.

As of right now nothing is finalized, but don't expect some arbitrarily unfair procedures. Just relax, and keep out of it.

>Another possiblity is a chip that SGS makes for Linear Variable
>Differential Transformers that has a synchronous detector.
>(The part number escapes me)

I believe the part number you are looking for is the NE5521. This part has two portions, one is an oscillator and the other is a synchronous detector. It is detailed in the Signetics data book and there was also an article in EDN on May 29, 1986 page 159.

I have used the 5521 (several years ago) for doing LVDT interfacing. It seems to work pretty good, but there are a few problems with it. We found that using the oscillator and detector at the same time causes problems. We solved this by just using the chip to do the detection and then had another oscillator that provided the drive signal for the LVDT. This probably won't

be a big deal for the application discussed above. The big problem that I see with this chip is that you need to provide a reference tone at the EXACT same frequency as you wish to extract the information from. This means that you would need to construct something like a PLL that would lock onto the incoming tone and provide a constant tone of steady amplitude as the reference. You might also have to do some phase shifting of the PLL output, depending on the type of PLL you create to extract the reference signal.
I think this chip would do a quite excellent job for signal extraction of the wefax signal, but haven't tried it yet.

If anyone out there has a good method of extracting a voltage signal from an AM modulated wefax signal from a satellite or other tips that would be useful, please let me know. I want to add an AM-to-FM front end to my wefax hardware so I can capture satellite transmissions directly. I have written a wefax receiving program for the amiga computer and now have some folks interested in trying to get signals from satellites. I'd like to just convert the AM modulation from the satellite to standard FM tones that could be fed into my existing system.

One possibility is to do like may people who use computers today. They get the latest and greatest programs people write and post on newsgroups and BBS's, ditch the source code because they don't understand that stuff, and just run the things and have fun.

If you don't care to write the problems, at least you can play around with trying one program after another, and/or setting their parameters and stuff.

It is all part of the learning experience anyway. You may not know a Laplace from a Fourier or how to convolute stuff, but if you figured out how to post on Usenet, you have most of the skills already.

This is bull! If the rules change on 2/15 then the VEs most definitely will be able to fill a 610 for a new tech license. The way I understand it is that those with existing exam credit will be grandfathered since there is no change in the questions involved.

>I argued that this was not fair. That someone who has the requirements is

>entitled to the license and this needs to be fixed.
     You're right, the problem is in your VE friends understanding of what
the new proceedure will be. By the way Just curious, but was this an ARRL VE
group, or one of the others?

I am looking for the optional 600 hZ cw filter for my recently acquired

Yaesu FT-101E. I am also looking for two rubber feet for the front of the radio (why anyone would remove these is beyond my understanding), and two side rubber feet. Finally, I am looking for a PB1292 noise blanker as the later PB-1582 is next to useless, unless somebody knows how to adjust the PB-1582 noise blanker to increase the amount of blanking.

Y.N. Miles,
VE7-ALQ,
<MULTI@TRIUMFcl.bitnet>

ps: The set came with all ten meter crystals pulled, and replaced with CB crystals for 26mHz,27mHz,and 27.5 mHz. I guess the CBer didn't want the 600Hz cw filter...

In general, maybe; but clearly the FCC wants the codefree license and that means they want the process to work. They won't throw a monkey wrench in the machinery needed to make it work.

No, but there's a Consitution and Civil Rights laws that say, "Before you say 'No', you'd better have a damn good reason." I doubt if "Dave Heller thinks it's bullshit" would qualify.

Because a VE is supposed to carry out policy, not generate it. Above all,
contrary to what Hugh Turnbull seems to be hinting, his approval or
'ratification' of FCC policy is not needed. A VE is entitled to his opinion,
but it should be expressed at the top of the funnel, not the bottom.

>can specialize and become technically proficient.

This is what ham radio is supposed to be, playing radio mechanic. Applicance users have the cellular phone, CB, and commercial two way. Our charter is to provide for self training in the radio art. Play is one of nature's most effective learning tools. That's why all young creatures exhibit the behavior. One of the best ways to keep ourselves young and vital is to exhibit more of this play behavior. One of the best ways to learn technological skills is to "play" designer or "play" troubleshooter. The most attractive thing about the new Technician license is that it gives us a better tool for enticing more people into the playground.

What is a bad thing is that our culture is turning away from technological play and thus turning away from learning technological skills. This has negative long term consequences for the health of a technology based society. Most people take utilities for granted and have little curiosity as to how they work. Yet people take their toys very seriously and often go to great lengths in both time and money to master them. Bringing the the people back to radio toys can have very positive results on the competitiveness of our society.

Quoting from paragraph 13 of the PR90-55 Report and Order:

"...For the amateur service to achieve its purpose it must have the participation of as many qualified persons as possible who desire to pursue that purpose. Modern commercial and military electronic systems require engineers to design them, technicians to install and maintain them, and a technologically literate citizenry that can use them. The amateur service should, as it has in the past, attract technically inclined persons, particularly the youth of our country, and encourage them to learn and to prepare themselves where the United States needs expertise. We do not forsee that telegraphers will be in as great demand by future systems as will electronics and communications experts."

: :

o FCC Says "YES" to No-Code

Instead of enacting its controversial proposal for a Communicator license, the FCC on Dec. 13 removes the 5 WPM Morse code requirement from the existing Technician Class amateur operator license. Praising Amateur Radio for its achievements, the five Commissioners voted unanimously for the change. Implementation of the new rules is expected by February 1991.

At the same time, the FCC voted to change Part 97 to include the procedures for exempting handicapped Novice and Technician hams from the 13 and 20 WPM Morse tests required for upgrading to higher license classes. The 5 WPM Morse text will continue to be required of all amateurs who desire HF operation.

Current holders of Technician licenses will be 'grandfathered', meaning that they will keep all of their current privileges (including HF privileges). After the new rules go into effect, new Technician licensees will receive all amateur privileges above 30 MHz. They may optionally pass a 5 word per minute Morse test to obtain the same privileges below 30 MHz enjoyed by Novices and current Technicians.

Technician licensees who pass the 5 WPM test will not receive any new callsign, nor will they have to use a suffix or other special station

ID. The new rules will not prescribe an official name for Technicians who have HF privileges. However, FCC staff told us they expect the name "Technician Plus" to be widely used in place of "Technician Plus 5 WPM Morse Code". This is also the name suggested by the No-Code Committee convened by the ARRL to consider a possible code-free amateur license class.

The Technician exam will consist of 55 questions from the current Novice and Technician elements, and will not include 5 proposed special questions about Morse code's "...utility and tradition". These two examinations may be taken together or one at a time.

The Commission decided to retain the Novice license in order to provide an alternative entry-level opportunity to those who can pass a 5 WPM telegraphy requirement in place of the more comprehensive written exam for the Technician. The Novice examination will continue to be available under the current system. Despite serious problems with fraudulent examinations, the Commission decided not to integrate Novice testing into the three examiner VEC examining program at this time. There is thus no change whatsoever in the current Novice testing program.

The full text of the FCC's decision was not available at presstime. The following is the FCC presentation and news conference in Washington:

(Ralph Haller, Chief, FCC Private Radio Bureau): "Good morning, Mr. Chairman and Commissioners. The Amateur Radio Service has a long history of pioneering advancements in the radio art. I thought you might like to see what the state of the art is right now in the Amateur Radio Service. Through various networks that have been put together by the voluntary time and personal funds of radio hobbyists, it's possible to communicate around the world with a small radio (displays a small hand-held rig).

"We believe that the items before you will encourage growth in the amateur service. Three people deserve special credit. They reviewed over 1,100 comments in response to two notices. I'd like to recognize John Johnston, Monty DePont, and Bill Cross, who will now present the items."

(William Cross): "Modern consumer, commercial and military electronics systems require engineers to design them, technicians to install and maintain them, and a technologically literate citizenry to use them. Many of our engineers, scientists, astronauts, educators and technicians took their first steps toward careers when they became amateur operators. We look to the amateur service to expand our country's resource of technicians and electronics experts.

"The advent of radio at the turn of the century brought the beginning of amateur radio. Eighty-nine years ago yesterday, at St. John's Newfoundland, inventor and experimenter Guglielmo Marconi received the first message transmitted across the Atlantic Ocean by radio.

The message consisted of three dots, Morse code for the letter 'S'.

"At that time, telegraphy was the only radio technology, whether amateur, commercial or military. Telegraphy has remained an unbroken tradition in the amateur service. Every amateur operator ever licensed in this country has passed a Morse code test.

"Lately however, there is concern within the amateur community that the current Morse code requirement is discouraging persons who could help the service more fully meet its purpose from participating in amateur radio. Now, as in the early 1900s, the amateur service is for technically inclined private citizens worldwide who engage in self-training, information exchange and radio experimentation. It is for persons who are fascinated by radio, and who enjoy a personal satisfaction in understanding and using the technology.

"Society benefits from the experimental nature of this service. The concept of broadcasting, for instance, began when listeners overheard amateur stations exchanging weather reports and baseball scores. The first land mobile systems were built by amateurs (as were) the first handheld radios. The first satellite system authorized by the Commission was an amateur station. Today, more than 30 amateur satellites have been launched. Amateur operators aboard the Space Shuttles communicate to other amateurs around the world. Amateurs pioneered communications by Low-Earth orbiting satellites, a technology just now being explored commercially.

"This service discovered the forefront of communications technology. Single Sideband, a narrowband voice emission, was adopted by our Air Force only after its capability was proved in the amateur service. Amateur operators moreover have always been at the cutting edge of digital communications technology.

"Society is well served by having amateur operators, with their transmitting apparatus, available in practically every area of the world. When a disaster strikes, such that normal communication systems are overloaded, damaged or completely disrupted, amateur systems assist relief operations immediately. Often, it is from an amateur operator on the scene that the outside world first learns of a disaster and of the assistance that is needed. In a situation like this, nothing can surpass having persons there who are ready, willing and most importantly, able to communicate. They temporarily bridge the gap until normal communications are restored.

"The amateur service should continue to attract technically-included persons, especially our young people, and encourage them to prepare themselves in the areas where the United States needs experts. The items before you, therefore, expand the access to the amateur service by amending the telegraphy requirements for amateur operator licenses.

"The first item, a Report and Order in PR Docket 90-356, exempts from the higher speed code exams persons who, because of severe handicap, are incapable of passing those examinations. We would rely on a physician's certification of disability to determine eligibility of an applicant.

"The second item, a Report and Order in Docket 90-55, establishes a codeless amateur operator license class by eliminating the code requirement from the Technician class operator license. These amendments will make it easier for today's technically-inclined persons to become involved in the world of radio communications. This, in turn, will help our country stay in the forefront of research and development. For these reasons, we recommend that these Reports and Orders be adopted. Thank you."

(Commissioner James Quello): "The amateur service is self-regulating, self-disciplined, and it compares to some of the other services most favorably. I think this opens it up to one, the handicapped; and two, the young. And I know the same type of self-regulation will continue. I don't know how important code is today. Is it being used less and less?

(Ralph Haller): "Actually Commissioner, there is still a fair amount of Morse code that is used by amateurs. But with the interest in computers it is probably being used less today, particularly by the people just now entering the service."

(Quello): "Well, I think it's good to open it up to those who may not be able to master the code. Most of it is done by voice today anyway. Excellent items; I approve them both."

(Commissioner Sherrie Marshall): "The amateur service has provided numerous contributions. This should open it up to attract more operators to the service while also preserving the traditional entry route for those who know Morse code. I also think it's appropriate for handicapped amateurs to take an even greater role in the service and that's why these two items deserve our support."

(Commissioner Ervin Duggan): "Mr. Chairman, I also support these items. Mr. Cross, I'm impressed by all the insights you gave in your presentation, the reasons we should appreciate the amateur service in its relationship to commercial services like the new low-Earth orbit satellites. I was fascinated to hear those connections made. I think you deepen our appreciation of the amateur service.

"One comment about the handicapped item. There was some fear in my office when this whole process began that we might be leaning over too far backwards to relax our standards and that in the process of trying to seem compassionate and responsive to the special needs of handicapped people, that we would in fact go too far and rob handicapped people of the pride they might otherwise have at being able to meet tough standards.

"I think in the process of receiving comments and reviewing this item, you have succeeded in removing that concern. I'm impressed by the large number of comments that came in. It speaks of the vitality and the tremendous interest on the part of people who are involved in this activity. I know that it imposed some real burdens on you, but you've done a good job and I'm happy to support these items, Mr. Chairman."

(Chairman Al Sikes): "I think that the team has done an excellent job, you've weighed carefully and come forward with a very balanced approach. This is clearly a vital service. The contributions in the service area, the equipment area, the emergency areas by amateurs have really been extraordinary. I would agree with Commissioner Duggan. Your report was helpful; it gave me some additional insights. I think that the steps that we have taken to broaden this now and invite more into it hold the potential of providing an even more vital, more dynamic service."

It was the Quarter Century Wireless Association that suggested simply eliminating the code from the Technician Class to arrive at a 30-MHz and higher frequency no-code ham ticket. QCWA made their proposal in their August 2nd, 1990, comments on Docket 90-55, the Codefree Communicator proceeding. They weren't the first to suggest eliminating the code from the Technician, however.

That distinction belongs to Dr. Michael C. Trahos, KB4PGC, a physician from Alexandria, Virginia. His May 1989 34-page proposal was one of the original twelve no-code petitions accepted by the Commission. Trahos asked for two new no-code license classes. He wanted the Novice and Technician Class names retained and renamed Novice Plus and Technician Plus ... for Plus Code.

He envisioned new code-free Novices being require to only pass Element 2 (Novice written exam) to obtain current Novice privileges above 30 MHz. The code-free Technician passing Elements 2 and 3(A) would get six meter privileges ... and all ham spectrum above 220 MHz. He exempted the two-meter band, but added he "...would entertain any additional proposals regarding ... expanding the new no-code Technician class privileges to include the 2 m band, 144-148 MHz ... based on comments, received to this Petition."

Dr Trahos wrote us "I view this FCC decision as a partial personal victory over the ARRL and their monopoly of Amateur Radio. It is, however, only a partial victory." He said it was still his personal opinion, supported by international experience, that a true no-code entry level license should only have written requirements less than or equal to that of the lowest obtainable code (Novice) class. He contends that a code-free Technician class by itself will "...fail to substantially increase the influx of new persons into Amateur Radio. Time will tell if these observations are correct."

Any 600 ohm or low impedance mic will do....A Yaesu YM23 or 22 would be
ideal...but try to find a used one is next to impossible nowadays....CES makes
some good DTMF mics....Also Midian...but noone makes a 16button mic that would
be an exact plug in for the Kenwood...(and I doubt there's a 12 button one
that would be that way too) almost any TT mic you get will have to have the
plug rewired for the 7400 4pin jack....(even the Yaesus I mentioned...)

Though they were supposed to be on CB, the HTs used in DieHard 1 looked like
Kenwood TH21 AT or BT series.....I havent seen DieHard2...
Needless to say, they would be hard pressed to make work on CB...
and I think the performance of them in the movies was a little out of reach
for what they would do in real life
(Check out in DieHard 2 a phone in the airport.....Supposed to be DC airport?
but the phones say Pacific Bell!...read that in a review!)

Since over a week has gone by since the release of the Report and Order
in FCC docket PR 90-55 and an electronic copy hasn't materialized yet,
I decided to start typing it in from the xerox-of-a-FAX I got in the US mail
from the ARRL last week. (If I had a cleaner copy I would have tried an
optical scanner, but my last attempt to scan a FAX was a complete
failure.)

The entire R&O is 6.5 typeset pages long. About 4.5 pages are the text of the order itself, .5 page contains the changes to Part 97, and 2.5 pages contain footnotes. I'm typing it in sections, the length of which are arbitrarily determined by when my arms get tired. :-) Here's section 1. It covers almost the first two pages of the printed R&O. (Hint: help in typing in the remaining pages would be welcome.)

Washington, D. C. 20554

PR Docket No. 90-55

In the matter of

Amendment of Part 97 of the   RM-6984 RM-6985
Commission's Rules Concerning   RM-6986 RM-6987
the Establishment of a Codeless   RM-6988 RM-6989
Class of Amateur Operator License   RM-6990 RM-6991
RM-6992 RM-6993
RM-6994 RM-6995

REPORT AND ORDER

Adopted: December 13, 1990; Released: December 27, 1990

By the Commission:

I. INTRODUCTION

1. On February 8, 1990, we adopted a Notice of Proposed Rule Making (Notice) [1] in the above-captioned proceeding. In the Notice, we proposed to establish a new class of amateur operator license (codeless class) that would not require applicants to prove that they can send and receive texts in Morse Code telegraphy signals. [2]

2. In response to the Notice, we received over 1,100 comments and 12 reply comments from individuals and organizations. The comments are generally supportive of an entry level codeless class. They differ widely, however, in support for the proposed license requirements, operator privileges, and license class structure. This Report and Order adopts the rules for a new codeless class license as proposed in the Notice with the changes discussed below.

II. BACKGROUND

3. The International Radio Regulations require that persons seeking a license to operate an amateur station prove that they have the ability to send correctly by hand and to receive correctly by ear text in Morse code telegraphy signals. [1] Although this requirement may be waived for an operator of a station transmitting exclusively on frequencies above 30 MHz, [4] each of the five classes of operator licenses

currently issued by the Commission requires the applicant to pass an examination in the international Morse Code. [5]

4. Over the years, we have received many requests from persons who argue that proficiency in telegraphy is an unreasonable barrier to obtaining an amateur operator license. When we proposed codeless classes previously, [6] nevertheless, the amateur community strongly objected. Lately, however, the sentiment of the amateur community appears to favor at least an entry level codeless license class. As a result, our Notice proposed to reprogram resources from processing applications for new Novice and Technician Class licenses to processing applications for licenses for a new entry level codeless class.

5. In the Notice, we stated the three fundamental objectives that we have with respect to the proposed codeless class. Our first objective is to offer an entry level operator license opportunity to otherwise qualified persons who find the telegraphy requirement a barrier to pursuing the purpose of the amateur service. [7] Our second objective is to establish a type of license that can be implemented promptly. Our third objective is to avoid negative effects upon current licensees, upon the work of the volunteer examiners (VEs), or upon the Commission's workload and resources.

6. In the Notice, we proposed to add a new entry level codeless "Communicator Class" operator license in lieu of the existing Novice and Technician Classes of licenses. We also proposed to grandfather current Novice and Technician Class operator licenses indefinitely. The operator privileges proposed included all authorized emission types, a maximum transmitter power of 200 watts peak envelope power, and authorization to transmit on amateur service frequency bands above 30 MHz with the exception of the 2 meter and 6 meter bands.

III. DISCUSSION

7. Approximately seventy percent of the comments to this proceeding favor at least an entry level codeless license. Some of these comments, however, advance proposals that go beyond establishing a single codeless class. [8] Other supporting comments suggest alternatives that would have undesirable effects upon present licensees. [9] Still other supporting comments suggest alternatives that would have unacceptable effects upon the VEs and the Commission's workloads. [10] The remaining thirty percent of the comments object to any form of codeless license. [11] In the paragraphs below, we address in detail the issues raised in the Notice and comments.

A. Need for codeless class

8. Proposal. Our Notice was issued in response to twelve petitions for rule making calling for codeless license classes. We observed that a significant segment of the amateur community appeared to have a new view of the role of telegraphy in the future of the amateur service. [12] We also stated that this was a propitious time to propose the establishment of an entry level codeless class, given the advances in

electronic communications in the past few years. [13]

9. Comments. Among those affirming the need for a codeless class is the Quarter Century Wireless Association (QCWA) whose comments state that "[m]any QCWA members have a lifetime history of operating with, and a sentimental attachment to, use of the Morse code. It is understandable that some may not be overly enthusiastic in endorsing changes in licensing procedures which would delete the requirement of proficiency in this traditional mode of communication. Nonetheless, after consideration of the facts associated with licensing trends, we have concluded that the blanket code proficiency requirement may be a major cause of decline in the entry of many people into the Amateur Radio Service. Given this conclusion and in recognition of our responsibility to the public interest, we are agreed that a blanket Morse code requirement for entry into the Amateur Radio Service can no longer be justified." [14]

10. The American Radio Relay League, Inc. (ARRL) states that our objectives in this proceeding are basically sound and are consistent with its own rationale for the creation of a codeless class. [15] An ARRL study committee has concluded that the perception of the Morse telegraphy requirement filtered out too many desirable and technically qualified operators who have not recognized the value of manual telegraphy as a means of practical communication. [16]

11. The National Conference of Volunteer Examiner Coordinators (NCVEC) states that it found ample evidence that the Morse telegraphy requirement is no longer essential to an entry level amateur operator license. [17] The Amateur Radio Industry Group (ARIG), another codeless class supporter, states that "[a]mateur radio has evolved from a hobby of tinkerers and telegraphers into a service of communicators... [T]he Morse code requirement at the entry level is a carryover from the origins of amateur radio which today may be preventing many interested and otherwise qualified persons from entering the Amateur Radio Service." [18]

12. The opposing comments hold that telegraphy skill is absolutely required for any participation in the amateur service. Their arguments are generally based upon claims for telegraphy as a superior communications medium and for telegraphers as model radio operators. Representative comments are as follows: "Morse code is the most effective means of communicating and the only one which can be used under the most adverse conditions." [19] "All hams must be prepared to use code in an emergency situation." [20] "We do not desire to have individuals join our ranks that would have us lower our standards." [21] Another argument is based on the need to maintain tradition. "I had to take the code when I got my ticket, so why should someone else pass the code up?" [22] "I believe everyone should be blessed with the glory of learning code before operating in the amateur frequency spectrum." [23]

13. Discussion. The comments clearly confirm that the amateur community is undergoing a dramatic shift in sentiment concerning the value of

Morse Code as an entry level license requirement. For the amateur service to achieve its purpose it must have the participation of as many qualified persons as possible who desire to pursue that purpose. Modern commercial and military electronic systems require engineers to design them, technicians to install and maintain them, and a technologically literate citizenry that can use them. The amateur service should, as it has in the past, attract technically inclined persons, particularly the youth of our country, and encourage them to learn and to prepare themselves where the United States needs expertise. We do not foresee that telegraphers will be in as great demand by future systems as will electronics and communications experts.

14. Telegraphy skill has been required for each person who has ever been issued an amateur operator license in the United States, including the current 493,000 licensees. Mastering the Morse Code was an arduous task for many of these licensees, and by developing their telegraphy skills they expressed their intense desire to become amateur operators. It is understandable, therefore, that there are licensees who are reluctant to share the amateur service frequencies with new licensees who have not made a similar effort to master the Morse code. We conclude, however, that telegraphy skill is not so essential to proper operation of a station that transmits exclusively above 30 MHz such as to justify turning away otherwise qualified persons who do not possess the skill. The Notice, furthermore, did not propose to delete the telegraphy skill requirement for a licensee to be the control operator of a station transmitting below 30 MHz where telegraphy communications take place extensively and worldwide communications are possible. The sharing of frequencies between codeless class licensees and other licensees can take place on frequency bands above 30 MHz where telegraphy operation is minimal and where the transmission of the more modern emission types such as data, image, phone, pulse, RTTY, and spread spectrum, predominate. [24]

15. We do not concur with the comments alleging that the passing of a telegraphy examination is an indication of the examinee's good character, high intelligence, cooperative demeanor, or willingness to comply with our rules. [25] These traits are also found in individuals who have not passed a telegraphy examination rather than being exclusive to those who have passed such a test. For regulatory purposes, passing a telegraphy examination is no more and no less than proof of the examinee's ability to send and receive texts in Morse code at some specified rate. With respect to comments that make claims for the superiority of telegraphy over other types of communications, we do not consider these arguments as germane to this proceeding. The Notice did not propose to discontinue the authorization of telegraphy CW emission types on any amateur service frequency. The amateur service in the future, as it has in the past, can provide to those who personally desire to do so the opportunity to communicate by telegraphy.

16. We are adopting rules, therefore, that implement the codeless license option provided in the international Radio Regulations. These new rules offer a codeless class of license that authorizes control

operator privileges at stations which transmit exclusively above 30 MHz. This satisfies our objective of providing an entry level opportunity to otherwise qualified persons who find telegraphy a barrier to pursuing the purposes of the amateur service.

B. Operator License structure

17. Proposal. Our Notice proposed to add a new codeless class in a simplified license structure containing four ascending steps, new codeless Communicator, General, Advanced, and Amateur Extra Classes. There would also be, in effect, a "Communicator Plus CSCE" [26] operator class which recognized that some Communicator Class licensees hold a CSCE showing the licensee has passed an international Morse code test but which would not require additional license processing resources. The codeless class would be the first step in the license structure instead of the Novice Class. We stated that this structure could be rapidly implemented because the present license processing system and application form would continue to be used. Our Notice, however, particularly asked the amateur community to consider carefully the alternative of preserving the existing five-step ladder by simply eliminating the telegraphy examination requirement from the Novice Class license.

A discussion about the grandfathering of those who have already passed elements 2 and 3A certainly appears to indicate that no one knows what will really go on.

However - - -

passing on FCC phone numbers to those who intend to be asking frivolous questions is just asking for trouble.

Every time a question is posed to the commission and there is an answer, the answer tends to be restrictive overall.

Unless you have a GOOD reason for calling FCC, ***DON'T***

Precisely why I have been trying to 'sell' the "HAM RADIO, the National Park of the Mind" idea.

>    You're right, the problem is in your VE friends understanding of what
>the new proceedure will be.

I spoke with one of my local VE's. His position is, Yes, it *sounds* like
the new Tech will simply be elements 2+3A, however, he has recommended that
I wait for him to get *official* word from the *FCC* before we waste both our
time on certification that may be useless to me without element 1A.

I agree with his position. Besides, waiting for Feb. 14, I might get bored
enough to learn the code long enough to pass 1A. Or 1B, or... (this is
significant to me, since without any real study effort, I am passing the
Hypercard Advanced question-pool random test about 50% of the time.)

Side-note: I have had absolutely no negative feedback from local hams regarding
my current desire to get a no-code Tech. (Technocode?? Bleah!) The VE asked out
of curiosity what facets of amateur radio I was interested in, and I promptly
responded, "Building things.." to which he replied, "My God! a *real* ham!!"

Oh, but don't you get it Phil? The purpose of rec.ham-radio isn't to
convey documented facts or inspire positive action, it is to support
self-supporting internal feuding and rumor! Cases in point:

1. Extensive threads about the CBS Report on scanner listening.
Despite frequent requests, neither the number and/or address for transcripts
and/or the address for CBS was posted. What was posted was a lot of
second-hand rumor and whining.

2. Based on a few sentences on an ARRL news release, there was alot of
extensive rumor and guessing about motivations of the ARRL. FInally,
some sensible people posted copies of bulletins and news releases
regarding the No-Code license. Also, KE3Z from the ARRL emphasized the
point that it's not ARRL policy until the ARRL decides that it's policy.
Preliminary statements and thinking are just that, PRELIMINARY.

>from the ARRL last week. (If I had a cleaner copy I would have tried an
>optical scanner, but my last attempt to scan a FAX was a complete
>failure.)

>The entire R&O is 6.5 typeset pages long. About 4.5 pages are the text
>of the order itself, .5 page contains the changes to Part 97, and 2.5

>pages contain footnotes. I'm typing it in sections, the length of which
>are arbitrarily determined by when my arms get tired. :-) Here's
>section 1. It covers almost the first two pages of the printed R&O.
>(Hint: help in typing in the remaining pages would be welcome.)

>--Phil, KA9Q

That's what secretaries are for! Don't they have any at that fancy PhD place you work at?

(Subtitle for the humor impaired: This post is strictly tongue-in-cheek. I do not advocate the use of secretaries for non-official purposes, unless they happen to be good looking :)

For the benefit of whoever asked:

They have no uucp map according to UUNET.UU.NET. House of Representatives, yes. Department of Labor, yes. Federal Reserve Board, yes. Democratic National Committee, yes.

Who has a zillion maps? The IRS, of course. Most featuring a feller by the name of Jon Albers, KA3OVK. (Remind me not to flame HIM on rec.ham-radio!)

The pattern of who has uucp addresses and who doesn't is so random that obviously it is purely a 'local option,' depending perhaps on who does the computer housekeeping chores. One map included the plaintive plea for more intragovernment connections!

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

>the wrong service.

Pacific Bell recently received a ruling from the FCC on this, that you may want to check out. The gist of it was that (a) the line is connected to amateur radio equipment, and nothing else; (b) commercial traffic is prohibited on amateur radio; (c) the phone line will therefore be only an extension of personal, not commercial, use; (d) therefore, amateur radio stations are entitled to residential rates.

This ruling may have been from the PUC, but complain to your state PUC, especially if they're elected officials. If that doesn't work, get some press like "Michigan Bell raises rates for emergency phone lines."

That should get some action.

Does anyone know where I might obtain a 600 Hz CW filter for a Yaesu
FT101? I am also looking for the two rubber front feet for the FT101.

Y.N. Miles,
VE7-ALQ,

On a similar theme, I had occasion to call the local FCC Field Office several months ago. I needed to know the licensees on a particular land mobile channel. (None listed, but plenty of monitored activity, BTW). The woman who handled my inquiry needed time to look it up in their files and offered to call me back. I was headed out so I told her to fax it; I would leave my machine on. She replied, "We're the FCC...we can't DO that!"

first off:thanx for all THE GREAT ANSWERS to my previous weather satellite questions

I have been offered a reasonable deal for a NEMS-Clarke receiver model 1701 (~10-400MHz) and it has no manual. I was wondering if anyone has used this for APT satellite reception (137MHz). or if anyone owns one of these could they give me an idea of what kind of gain I can expect?

thanx,

A friend has a handheld cellular phone. I have an AR 1000 scanner. I've been less than impressed with the high band sensitivity of the rubber whip antenna it comes with.

Anyway, just for fun I connected my friend's Radio Shack "high gain portable cellular antenna" to my scanner using a TNC-to-BNC adaptor. Wow! The gain is MUCH batter on all bands down to aircraft. It's a bit pricey ($29.95) but does seem to make a much better scanner antenna on VHF-hi and above. And it's much less of a pain than the BNC-base telescopic antennas.

I repeat: if you're thinking about calling the FCC *** D O N T ****.
Every so often someone manages to get in a pissing match on the phone with someone in the FCC and out comes a ruling giving everyone headaches.
As for getting any answers about testing, etc. from a field office: not much chance. You're lucky if you can get a reference to where there are VE sessions in your neighborhood.
Please leave the mechanics to our quite able crop of VEC's, mainly ARRL and W5YI.
Both are quite with it, are trying to be fair to everyone, have the proper lines of communication, and will broadcast everything that should be known as soon as is practical.

As for Jim's comment about the FCC >>> monkey wrench, etc <<<< the FCC has abdicated all testing business to the VEC's and quite clearly doesn't want to be bothered, and for a good reason: their budget has been cut to the point that their absolutely necessaryh commercial work is suffering, and they just haven't the facilities or time to do much for the Amateurs. My first hand experience has been exceptional cooperation to the extent possible, but we hams have to take a low priority in their work schedule and the way things are they'll never be caught up.

Summary: do everyone a favor and stay clear of the Commission. You can get all the answers you want either from your Section Manager, your Division Director (You ARE an ARRL member, aren't you), or if you're a VE, your VEC.

Jim, I have to agree that your " . . . " would hardly qualify.
However,
Is an amateur license a god=given or constitutional right --
or is it a
Privilege to be earned.
I made an earlier posting of part of a club paper article
giving three facecious waiver cases plus
three real-life instances of terribly handicapped amateurs
who can or could outrun most of us -

a totally blind-deaf elderly man who is not only a really good
operator and a pleasure to engage in QSO, but also has served
ACTIVELY as an officer of his club.
-- His opinion of waivers is hardly to be repeated.
Did you ever have the pleasure of workng the late K9EAB? If so,
you're a real top speed CW op, as otherwise you could have never
kept up with him, and you'd never have guessed he wore an iron
lung and had essentially zero muscular control below the neck.
And K3KTH. A regular traffic net control, and a good one. I
wondered why his CW occasionally took off "uncontrolled" for a
few seconds until I met him. A brilliant young fellow, but
tightly strapped into his wheelchair because of his spastic condition.

I've discussed this Waiver bit with sociologists who work with the
handicapped; the general feeling is that it would be nice if
everyone could do everything, but things don't work that way.
If a handicap prevents you from doing something, well, so be it.

(Note that the way this bit is written up I think I could qualify
for a "free" Extra, due to a manual motor control problem. I
unfortunately went for the Extra 30 years too soon.)

If the "ruling" actually prevented some deserving people from being
shut out of Amateur Radio I'd be all for it. It doesn't. They
still have to pass the 5 to get the N+T privileges, and now need
only 2 & 3A - no code whatever - for VHF. The higher grades
do require more - 1B or 1C, 3B, 4A and 4B - in order to get everything.
Some find element 1 to be their biggest problem (that includes me).
Som e have problems with the theory, even though it's been simplified
so much by publishing all the questions and answers, so that plain
memorization can do the job that used to require knowledge.
How about those who are handicapped by a comparatively low IQ?
Should they just sign a statement that the test is too hard for them
and get an automatic Advanced?

The varied handicapped rulings as I interpret them (and I admit
not to having studied them at length) prevent discrimination
because of "condition". I'm all for it.
But to say that because of some condition someone should be given
something that is hardly necessary to his welfare because of hjis
handicap is to me a bit different. Reverse discrimination?
Who cares. But it is in reality the biggest insult to the
true handicapped people who have proven themselves in spite of
their "conditions".

Am I inviting some flaming? I hope so, and I welcome it.

And, Jim, I enjoy your postings. Keep up the good work.

73 to all

> contrary to what Hugh Turnbull seems to be hinting, his approval or
> 'ratification' of FCC policy is not needed. A VE is entitled to his opinion,
> but it should be expressed at the top of the funnel, not the bottom.
> Jim Grubs - via the friendly folks at UUNET

To add to Jim's comment:
The VE has volunteered for the job.
It is time consuming, and if properly performed, gets
thanks from many, and bitter complaining from a few.
The VE, in accepting the job, agrees to follow the
book to the letter and while on the job keep his comments
to himself. He does have the right to refuse testing
to any individual, at least that's the way I understand
it, but that in practice should be limited to the
disruptive individual who is unwilling to follow
instructions. If a VE doesn't like any part ofthe
system he's free to leave it, and probably should.

About Hugh Turnbull: though I've only spoken to Hugh very
briefly on the air in the past couple weeks, I strongly
believe he's been misquoted somewhere. I don't know
first hand how the other directors work, but Hugh tries
successfully to learn how the thoughts of the entire
Amateur community are running (this through personal
contact and a strong Vice Director + Assistant Director
network) and make things in general do as the majority
would have it. Naturally this leaves the minority madder
than hell. His past contacts plus his location make him
one of the prime DC contacts for ARRL. His working life
resume' is impressive. In my opinion we're lucky to have
such a man devoting the effort to Amateur Radio. Hugh is
accessible to everyone - letters are usually answered by

return mail and his phone is published in QST. And he shows up at more hamfests than would seem possible.

FROM ARRL HEADQUARTERS NEWINGTON CT
JANUARY 4, 1991
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

THANKS TO JOE SAND, KnGX, AND THE TRISTATE DX PACKET CLUSTER NETWORK, FOR THE FOLLOWING DX INFORMATION.

AFGHANISTAN, YA. THE YA0RR OPERATORS WERE DELAYED IN TASHKENT FOR ONE DAY ON ROUTE TO KABUL. THEY VISITED THE SOVIET EMBASSY IN KABUL, JANUARY 2ND, AND ARE NOW RETRIEVING THEIR EQUIPMENT FROM CUSTOMS. OPERATIONS COULD COMMENCE AT ANY TIME. QSL YA0RR VIA ROMEO STEPANENKO VIA BOX 812, SOFIA 1000, BULGARIA. RTTY CONTACTS MAY ALSO BE CONFIRMED BY UT5RP. STATIONS WITH MORE THAN ONE CONTACT PER MODE MAY FIND THEIR WAIT FOR A QSL TO BE LONGER THAN OTHEJS.

BAHRAIN, A9. A92BE HAS A BIG SIGNAL ON 75, 17, AND 12 METERS AND IS EXPECTED TO BE ON THE TOP BAND AT ANY TIME.

CENTRAL AFRICAN REPUBLIC, TL. TL8SC, CARL, LIKES 14 MHZ SSB AT 2300 UTC.

COMOROS, D68. D68JM STILL ROAMS 20 METER SSB AT 0300 UTC. TRY 14153 KHZ. QSL VIA WV4F.

ETHIOPIA, ET. GABI, DL2BCH, SAYS THAT AN ITALIAN GROUP HAS 3 COMPLETE STATIONS SHIPPED TO ETHIOPIA IN ANTICIPATION OF A LICENSE. IK6DPW EXPECTS TO ARRIVE JANUARY 15. IF HE IS SUCCESSFUL IN OBTAINING A WRITTEN LICENSE, OPERATIONS WILL COMMENCE IMMEDIATELY. QSL VIA I8YCP.

IRAQ, YI.   YI1BGD LOGS UP TO OCTOBER 13, 1990, HAVE BEEN HAND CARRIED
Y1{p2,@x.p"@`.p2*&ajpOUT OF IRAQ. CONTACTS WITH OPERATOR SAMI, QSL VIA ON7LX.
CONTACTS
OUT OF IRAQ. CONTACTS WITH OPERATOR SAMI, QSL VIA ON7LX. CONTACTS WITH OPERATOR ALI, QSL VIA JR1AIB. CONTACTS WITH OTHER OPERATORS, QSL VIA JL1BLW.

KURE ISLAND, KH7. KD7P/NH7 HAS CONCLUDED A SUCCESSFUL 2 WEEK OPERATION HERE AND INFORMS US THAT KH6JEB WILL VISIT KURE IN FEBRUARY.

LORD HOWE ISLAND, VK9. JOE, N4MQX, PLANS TO OPERATE FROM HERE DURING MARCH, INCLUDING THE WPX SSB CONTEST. HE WILL BE USING A BEAM AT FIFTY FEET.

MALAGASY REPUBLIC, 5R. 5R8JD HAS BEEN ACTIVE THIS WEEK. 5R8GN OPERATED 12 AND 17 METERS, POSSIBLY FOR THE FIRST TIME EVER FROM HERE, ON JANUARY 2.

MONACO, 3A. LOOK FOR 3A/F9UW/M ANY MORNING ON 17, 15, 12 OR 10 METER SSB.

NIUE, ZK2. LOOK FOR ACTIVITY FROM HERE BY MID-MONTH, AS ELI AND MIKI MOVE ON FROM THEIR ZK1 OPERATION.

SAN FELIX, CE0X. XQ0X HAS BEEN ACTIVE ON 14236 KHZ AND ALSO ON 10 METERS IN THE MORNING.

SIE2bA*LEONE, 9L. 9L1US HAS A BIG 75 METER SIGNAL AT 2100 UTC.

TEN METERS SEEMS TO BE THE BEST PLACE TO HUNT DX THESE DAYS WITH A22AA, A71CD, FP8HL, H5AW, JY5FA, OD5RX, OY9JD, TA3PB, T77T, VK9NS, XQ0X, ZD7VC, ZD8DX, 8Q7BX, AND 9H4R RECENTLY HEARD OR WORKED.

GOOD LUCK WN DX,DF KB8NW/OBS

PROPAGATION FORECAST BULLETIN 1 ARLP001
FROM ED TILTON, W1HDQ SPRING HILL FL
JANUARY 3, 1991
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

SOLAR ACTIVITY IN DECEMBER MADE A STRONG FINISH FOR THE FIRST YEAR OF THE NEW DECADE. PREVIOUS MONTHS HAD FLUX READINGS AS LOW AS 122, BUT THE DECEMBER LOW, WHICH CAME ON THE FIRST DAY, WAS 176. ALL THE OTHER DAYS REACHED 182 OR HIGHER. THE DECEMBER PEAK, 239, WAS THE HIGHEST SINCE AUGUST. PROPAGATION WAS GENERALLY GOOD, AND THERE WERE NO SERIOUS MAGNETIC DISTURBANCES.

THE NEW YEAR STARTED WITH THE FLUX AT 184. THE SURFACE OF THE SUN WAS ALMOST UNCHANGED IN RECENT DAYS, AND NO NEW ACTIVITY WAS SEEN TODAY. HOWEVER, NEW LIFE IS EXPECTED SOON. THIS BULLETIN WAS SHORTENED BY HOLIDAY DOINGS. BOTH NEW SOLAR ACTIVITY AND THE TIME TO USE IT SHOULD PROVIDE MORE LIFE FOR NEXT WEEKS BULLETIN.

SB RTTYDX @ ALLBBS $RTDX0104
RTTY DX Notes 1of3 1/4/91

RTTY DX Notes for week ending 4th January 1991
BID: $RTDX0104
Part 1 of 3.

We hope that you all have a happy and peaceful 1991, with lots of DX.

In this job one does a lot of looking around the bands, and it never ceases to amaze me the lack of protocol knowledge demonstrated by some stations, especially by the computer buffs. It seems that most of them assume that the computer inserts the carriage return-line feed for them, but in a lot of cases it does not, and so the people with the printers acquire a black dot on the right hand side of the page, or maybe there is a carriage return but no line feed, so the whole QSO finishes up on one line. Makes it very hard to read. The correct protocol (from years back) is two carriage returns, one line feed and two letter cases for each line. Then you are sure that the other chap is receiving you. Oh yes, the line length is 64 characters.

Our thanks this week go to DJ3IW and the Saar/Pfalz Packet Cluster, I5FLN, I5ICY, I5IGQ, JA1BLV, OD5NG, TG9VT, VE3OXC, VE3XJ, VK2EG, W2JGR and the Tri-State DX Packetcluster Network. Thank you all for your help and news and hope that it will continue for a long time. Have a happy year chaps with lots of DX.

```

RTTY DX Notes for week ending 4th January 1991
BID: $RTDX0104B
Part 3 of 3.

QSL Information:

VP8CEL was just a visitor to the Falkland Islands, so QSL to G4PVM.

ZB2JB will QSL via Box 292, Gibraltar.

LY2BBF requests his cards go to Box 1029u, Vilnius, Lithuania, 232012 USSR.

VP2EE says to QSL to KA3DBN.

4Z80TA will QSL via 4X6LM.

3B9RF stated he would like his cards via Box 31, Rodriguez Island, via Mauritius.

Notes of Interest:

YA0RR RTTY frequencies are 14082, 21082 and 28082 KHz. Other frequencies and operating proceedures are available from your local mailboxes (in most cases). They will also include the QSL path for those other modes. RTTY QSL cards go to UT5RP. He has shown up on CW on 21 MHz, but some people did not think that he was real and were deliberately jamming. There are some lovely people around these days.

9H3HTH is a special call for 'Help The Handicapped'. Give them a call.

4Z80TA will be active until 30th January.

YS/WD4IFN, Herman says that he will be there for three years.

'HE' is a special call for the 'HB' stations and will be used all of this year.

Hope that you have a happy 1991

GL DE DX1 (VK2SG) AT TG9VT.

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA. Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU, or via the VK2AGE AMTOR APLINK mailbox system.

Well, look to history. Around the turn of the century "manual" jobs were out of fashion and so trade skills like plumbers were in very short supply. One offshoot of this was that William McKinley was shot in 1901 and might well have survived except that the facilities were inadequate and he took an infection. If there had been proper plumbing (which would have been if there had been plumbers, which would have been if plumbing hadn't been considered a 'dirty' career) lots of history might have been rewritten.

An observation:

AMSAT have stated that various bits'n'pieces of software are available FREE on the AMSAT/DRIG BBS.

There is one caveat - as far as I am able to discern, you do not have downloading privileges on DRIG BBS unless you pay for them.

Question:

A) Am I missing something on DRIG? (an additional validation step, something else?)

B) If this Catch-22 does exist, is there anyone out there with access to the free components of the AMSAT software library that would be willing to work with me to get them posted on FREE amateur boards more readily?

Lee

(Please, don't start waffling on about how everyone should pay to support their local/remote BBS etc., I already do more than my share of uploading to support the buggers I regularly use....)

My FT-23R has been acting weird lately. Sometimes there is no audio when it is first turned on. Wiggling the battery pack seems to aggravate the problem. I cleaned the contacts on the radio and battery pack but that didn't help. Does anyone have a fix for this? Is there some magic conductive goop that will insure a solid electrical connection?

You might try putting "Address Correction Requested" on the envelope.
I *think* that this info is kept around after 1 year -- it is probably worth
.25 to find out (they just won't forward mail for free after a year)
if the info is available thru this channel.

The other possibility is to try getting in touch with his parents if
they are still alive, who can probably give you the address.

>

What I am interested in is this:  Which rigs, besides the wealth of fine
quality used equipment out there, would be good ones for a beginning ham?

I expect my first license to arrive in a few weeks, and I am wondering which
of the commercial rigs (that is, stuff from Yaesu, Icom, Kenwood, etc.) would
be a good starting rig for myself, in the event that I decide not to go for
used equipment.

I myself am interested in any comments that you people may have on Icom's
725, 726, and 735 models.  How is the performance on these beasts?  How easy
are they to use?  Things like that.

I'd love to hear anything that you all may have to say on this.

Thanks,

>Rick N6RK

To the gentleman asking questions about PICCOLO equipment -

I have never seen any PICCOLO hardware of either first or later
generations appearing on the market. The British Diplomatic Wireless
Service did use it, but I think they upgraded to another mode during
the late 70's. (I vivdly remember a demo of PICCOLO I attended in the
late 60's...of course, you shoulda seen the analog hardware they had
to use...)

HOWEVER - the same guy that designs the Universal M-600/800/1000/7000
is still considering building a PICCOLO add on unit that will work
from the M-7000's accessory connector. If you're interested, give Fred
```

Osterman at Universal Radio a call (he's a good guy, not only does he sell gear, he loves the hobby too!) and tell him that you want to add your vote t6o PICCOLO add-ons and to pass it on to the guy in Florida who's the daddy of this hardware!

If enough of us do this, perhaps they'll definitely start producing once it's clear that they can at least break even on the darn thing...

```

Organization: St. Joseph's Hospital/Medical Ctr, Phoenix, AZ
Lines: 20

I would like to bring the lead of my packet setup (RG-8U) through the window at my home on a semi-permenant basis. However my wife, is leary of leaving the window open due to security, and is not thrilled on having me drill holes through the wall. Her solution is to just open/close the window when I want to use my packet setup, which unfortunately doesn't allow me to leave a mailbox on the air 24 hrs.

Any suggestions on something that could be constructed to bring the cable through the window on a semi-permenant basis, but keep some security. The window is a two plane glass, with one plane sliding to the side to open.

thanks.

I read a terrific Eimac application pamphlet about 30 years ago describing an
amplifier design in which the chassis was at screen voltage potential and the
screen grids were "grounded" directly to the chassis at the socket pin,

eliminating (reducing) parasitic oscillation problems do to resonance in the screen bypassing components.

Those Eimac application notes were a treasure house of great ideas in amplifier design and mechanical construction techniques. I used to drool over them by the hour. Of course, as an impoverished student I could never afford to implement any of the ideas.

```

> pieces of spectrum there in the satellite bands at UHF and above.

Most observers at the time we lost those satellite bands attributed it to the fact that the HQ leadership was totally HF / CW oriented and just failed to recognize the danger to future usage trends and plan accordingly. Whether they learned their lesson is problematical. Considering their footdragging on codefeee until they saw the handwriting on the wall, there is considerable justification for skepticism

Be that as it may, it is clear that FCC contempt for the ARRL is at an all time high. One wonders, then, whether ARRL 'help' on WARC might do more harm than good.

The FCC used to rely on ARRL help in providing a window on thought among hams on the direction ham radio was taking or should take. I think they have decided that ARRL no longer provides a clear picture of what's what out here. I think they would like others to step forward and fill the void. Who?

In Toledo we have what's called "The Committee of 100". This is a group of the leaders and experts in civic, social, humanitarian, business, labor, art, and education circles. As local problems come up this group divides up into ad hoc specialized subcommittees and attacks the problems, also coordinating private and government efforts. It works pretty well. Maybe ham radio needs a Committee of 100.

After more than 8 years away from ham-radio (license expired 1982), I have caught the bug again and want to get my license back. I know I'll have to re-learn some regulations and practice my CW (yes, I want to get my general class back and I am looking forward to the CW - it was my favorite). But where would you start?

To avoid obvious bandwidth, please email me any answer you might be able to provide to the following questions:

How does the testing procedure work with volunteer examiners ? I only remember those well-suited FCC examiners at some major city far from where I lived!

How much does the exam cost?

Can I get my old call sign back? Can you request call signs these days?

What texts would you recommend for study?

What would be a good receiver/transceiver to invest in that does CW/SSB in the price range of about $300 (are there any?)?

Thanks in advance and can't wait to get back on the air!

Dave Swartz - formerly WA3YNF 73s, folks!

Agree about the quality of the 757. I've used them. Right up with
modern Yaesu quality, which stinks.
The whole Kenwood line is certainly superior to the Yaesus, which is
not much of a recommendation. After what I'm used to, a 440 is a loser
Likewise 430, 930, 940. Reading between the lines of the latest QST
the Kenwood 950 isn'
isn
isn't all that good either.
Of the "Asian riceboxes" (I have other names for them, but some seem
to take offense) the Icom line seems to be the best.
The US-made stuff (Tennessee did get readmitted I think) beats the
Kenwoods and Yaesus in every regard, and at peaks of both is essentially
equal to the best Icoms; for ease of operation and serviceability there
is no coparison.

What's the big problem with used equipment? If it's Drake or Ten-Tek
you can't go wrong - anything needed to bring to new condition is
simple. Or do you have your heart set on an import?

Again: Power of Advertising.   Quality be damned.

>
> What I am interested in is this: Which rigs, besides the wealth of fine
> quality used equipment out there, would be good ones for a beginning ham?

Probably the best possible beginner's setup is either a TR4 or Triton-
540-544 (all the same thing) plus a decent tuner (NOT MFJ!) + home-brew
wire antenna + keyer, preferably home brew for about $20 max with a
Curtis chip. Plusses:

1. Easy to use
2. Out-perform most of what the other hams have.
3. Easy enough to fix yourself.
4. Highly affordable (or don't you care?)
5. Excellent for CW (which most of the *oriental imports* are NOT.
6. Make a positive impression on the old-timers as having the
    intelligence to have good equipment.

> are they to use? Things like that.
> About the 725-6-35: performance at the upper end of the *oriental* range

Ease of use: Poor
Serviceability: Better than zero, but not much.

> I'd love to hear anything that you all may have to say on this.
Do you still mean that last statement?

I've posted extensively on this before so I'll try to keep this short. :-)

In my opinion the IC-735 is the hands down winner of the performance/price
catagory. Unless you are putting together a multi-kilobuck contest station,
you can't beat the 735. It's got a great receiver, the transmitter cooling
system is superior, the size is ideal for mobile, yet it is not difficult
to use the controls, all control functions are straight forward and, again
in my opinion, work the way you would naturally expect them to work, the

display is easily readable in all lighting conditions, and most important of all, you can abuse it unmercifully without hurting it. The 726 does have six meters if that's important to you, but both it and the 725 lack the selectivity and digital interface capability of the 735.

The only rigs I would consider to replace the 735 are the IC-781 and the TS-950. And I would think long and hard before trading the 735 for either of those expensive behemoths while I continue to enjoy portable and mobile operations.

There are many BBSs that carry the various AMSAT and AMSAT-related free bits'n'pieces. Tells us where you live, and i'm sure somebody will come up with a BBS phone # somewhere near you. If you're near San Diego, for example, you can use Radiosport 619-279-3921. If there's something specific you're looking for, please advise, and someone will help you find it.

>(Please, don't start waffling on about how everyone should pay to support

Ok. I won't.

18. Comments. In general, the comments object to the proposal to discontinue issuing new Novice and Technician Class licenses. The NCVEC, in particular, stresses that the volunteer-examiner coordinators (VECs) desire that the existing license structure should be preserved to the maximum extent possible. It proposes the addition of a sixth class of license, although "[t]he VECs recognize that [this] position is not resource neutral ... This does not mean, however, the VECs would be any less in favor of a codeless license if the Communicator Class could only be implemented in place of one or more other classes." [27]

19. The QCWA states that another operator license class is unnecessary. It contends that the codeless class can be best implemented by simply removing the telegraphy requirement from the Technician Class operator license and modifying its privileges to comply with the International Radio Regulations. [28] The ARRL maintains, however, that there should be two paths of initial entry into the amateur service, (a) the current code-required Novice Class and (b) a new codeless class. The ARRL acknowledges, however, that the resulting "six classes of amateur license are, for the long term, perhaps an overly complex scheme, (but) the matter can be revisited in the future, after the Amateur Radio Service has had some experience with, and becomes adjusted to, the now new concept of a codeless license class." [29]

20. Our inquiry concerning the desirability of conversion of the Novice Class into a codeless class was not supported generally. The ARRL states that a codeless class would not be a suitable substitute for the Novice Class as an entry level license. It adds that closing off the telegraphy "route of entry for the Service would in fact stifle a large percentage of the newcomers to the Service." [30] The NCVEC reports that a survey of VEs shows that "[m]any newcomers would still prefer to obtain a Novice Class license, which is also the least expensive path into amateur radio." [31] The QCWA "also urges that the Novice Class license ... be continued ... [as] a route for the person who finds little difficulty with a Morse code requirement but lacks the extensive skills and technical knowledge required by the Technician Class examination." [32]

21. Discussion. The addition of a sixth class of license to an already intricate license structure is neither desirable nor achievable without unacceptable effects upon our workload. Even if there were no increase in the number of new licensees, adding a sixth license class would result in an increased demand for license application processing; most newcomers to the amateur service initially obtain the lowest class of license and those who subsequently advance to the higher license

classes usually do so one class at a time.

22. The disadvantages of a sixth license class are further compounded by the nature of our computer-aided application processing system. On further investigation, we have determined that our present computer system will not support six classes of licenses without new and significant expenditures of resources. The additional work to modify the system to have the capability of supporting the processing for a sixth class of license is inconsistent with our objective of limiting impact on our workload and resources. A new Communicator Class of license, consequently, is not a viable solution. The codeless class, therefore, must be incorporated into the present license structure.

23. Because it requires the least difficult written examination, the option of converting the Novice Class to a codeless class is not a solution generally supported by the commenters. The Novice Class, moreover, has very limited privileges above 30 MHz. [33] The Technician Class, however, has a more difficult written examination and authorizes all privileges above 30 MHz. The conversion of the Technician Class to a codeless class, as allowed by the international Radio Regulations and as recommended by QCWA and other commenters, [34] therefore, is the logical choice. Approximately ten percent of new licensees already enter the service at the Technician Class level. [35] The 126,543 current Technician Class licensees, however, are also authorized the same limited privileges as Novice Class operators below 30 MHz on the basis of having passed a telegraphy examination. To achieve our goal of avoiding any negative effects upon current licensees, therefore, we can make provisions in the rules for these licensees to retain all of their current privileges. [36]

24. We are, accordingly, establishing the Technician Class as the codeless class of license that includes all amateur privileges above 30 MHz. We are amending Section 97.301(c), however, to grandfather frequency privileges below 30 MHz to current Technician Class licensees as well as to authorize these privileges to those holding a Technician Class license issued on or after February 14, 1991, who pass a telegraphy examination. [37] This satisfies our objectives of establishing a type of codeless class of license that can be implemented promptly and avoiding negative effects upon the work of the VEs or upon our workload and resources.

C. License requirements

25. Proposal. The Notice proposed to require applicants for the codeless class of license to pass a sixty question written examination. Thirty questions would be drawn from the current Element 2 question pool, twenty-five questions would be drawn from the current Element 3(A) question pool, [38] and five questions would be drawn from a new pool. In effect, applicants for the new codeless class would be required for the current Technician Class license, plus five additional questions.

26. Comments. The ARRL comments support our proposal and state that the

five additional questions should concern operating practices. [39] Other comments call for even more written questions. [40] Sill others recommend fewer written questions. [41] The NCVEC, however, points out that the only purpose of testing is to assure that the licensees are qualified to operate amateur stations on the frequencies authorized for the class of license held. [42] It recommends that the codeless class license requirement by the passing of the existing Element 2 and 3(A) examinations. [43]

27. Discussion. As pointed out by NCVEC, the written examination is administered solely to determine of the examinee possesses the operational and technical qualifications required by a station operator to perform properly the duties associated with the privileges of the license sought. [44] Our rules require that each examination question set administered to an examinee must use questions taken from the applicable question pool [45] and each pool must contain at least ten times the number of questions for a single examination. [46] The question pools for Elements 2 and 3(A), therefore, should already contain questions that test whether an examinee has the requisite qualifications to perform properly the operator duties at an amateur station transmitting exclusively above 30 MHz. We are not convinced that the addition of five questions is needed to establish the operational and technical qualifications of examinees for licenses having these privileges.

28. Each examinee is responsible for knowing the answers to the entire body of questions in the question pool. In the interest of practical examination administration, however, the VEs ask the examinee only a sample number of questions from the pool and they require a passing grade of approximately 74 percent. [47] When technological advancements, operating trends, or rule amendments alter the duties of a particular class of amateur operator license, the effect of our rules is to require that the VECs revise the question pools accordingly. The deletion of privileges below 30 MHz does not call for an increase in the number of questions posed in the written examination for a Technician Class license. Preparing and administering additional examination questions, moreover, would increase the workload of the VEs and VECs. We decline, therefore, to change the number of questions in the written examination elements required for the Technician Class license.

D. Technician Plus Certificate of Successful Completion of Examination

29. Proposal. The Notice proposed that upon passing a telegraphy examination, a codeless class licensee would be authorized Technician Class privileges below 30 MHz. To avoid an increased license processing burden, our proposal was that the documentation of the passing of the telegraphy examination be indefinitely evidenced by the Certificate of Successful Completion of Examination (CSCE), rather than by the issuance of another license document. [48] Each VEC would be required to provide paper or magnetic listings to the Commission for codeless class licensees who had been issued a CSCE for passing a telegraphy examination.

30. Comments. The NCVEC advises that the VECs could permanently document whether an examinee has passed a telegraphy examination that was administered by VEs, but that use of a CSCE for this purpose would result in enforcement difficulties and would create a record keeping burden. [49] The ARRL adds that use of a CSCE for indefinitely documenting that a licensee has passed a telegraphy examination would be unwieldy. [50]

31. Discussion. The comments of NCVEC and ARRL, in effect, recommend that the documentation showing that a codeless licensee has later passed a telegraphy examination be accomplished by the Commission issuing a sixth class of operator license. The sole purpose of this sixth class would be to distinguish those codeless Technician Class licensees who subsequently pass the five words per minute telegraphy examination from those who have not. In paragraphs 21 and 22, we discussed why the addition of a sixth class of license is impractical.

32. We do not agree that use of the CSCE to indefinitely document the passing of a telegraphy examination would have any significant negative effects in this instance. The VEs and VECs already perform the necessary work. The VEs now issue a CSCE to each successful examinee. The VECs receive from the VEs the application forms and test results for every examination session. The VECs are required to make their examination records available to the Commission. [51]

33. We do not foresee, moreover, that there will be any increase in enforcement difficulty resulting from using the CSCE to document the p[assing of a telegraphy examination for an indefinite period. Our rules already authorize a licensee holding a CSCE to exercise the rights and privileges of the higher operator class for a period of up to 365 days. [52] This provision has not resulted in any increased enforcement burden. Section 97.301(e) is amended, therefore, to implement our proposal to use the CSCE to document indefinitely the passing of a telegraphy examination for the purpose of authorizing to codeless Technician Class licensees privileges below 30 MHz. We will confer with the VECs to establish a schedule for reporting the call signs and names of "Technician Plus CSCE Class" operators. [53]

E. Novice Class

34. Proposal. The Notice proposed to discontinue issuing new Novice Class operator licenses and to grandfather existing licensees. We particularly invited instructors, VEs and VECs to submit factual information on the time and effort that would be required for persons to prepare for the codeless class written examination as compared to that required for the Novice Class license written and telegraphy examinations.

35. Comments. The few comments that addressed our question generally predict that, given the choice between a five words per minute telegraphy examination or an additional written examination, the numbers of newcomers choosing one over the other would be evenly

divided. [54] The other prediction was that most newcomers would find additional questions easier to master. [55] The ARRL states that a codeless class would not substitute for the Novice Class, and that discontinuation of the Novice Class license would stifle a large percentage of the newcomers to the service. [56]

36. Discussion. The comments reveal that the amateur community, while it supports the establishment of a codeless class, is uncomfortable with the prospect of discontinuation of the Novice Class. The Novice Class is generally intended for beginning amateur radio telegraphers to gain actual experience in sending and receiving telegraphy messages. The comments indicate that the amateur community desires to retain the Novice Class license as an entry level for persons who do not have the knowledge to pass the written examination for the Technician Class license, but who can pass a telegraphy examination.

37. The keystone of our proposal was to reprogram resources currently expended in processing new Novice Class licenses annually to processing the new codeless class licenses. Retention of the Novice Class, however, precludes reprogramming all of those processing resources for the new codeless Technician class. We estimate, however, that with our current resources we should be able to process the applications for new Novice and codeless Technician Class licenses. [57] The Rules we are adopting, therefore, retain the Novice Class license.

F. Other matters

38. We are persuaded by the comments [58] that our proposal to use the two-letter station identification indicator system [59] to distinguish stations having Technician Plus CSCE control operators is inconsistent with the call sign assignment policy. It would, in effect, cause the stations of codeless Technician Class operators to be identified with shorter call signs than those having Technician Plus CSCE operators. Shorter station call signs, however, generally are reserved for the more accomplished higher class operators. Further, in three of the frequency bands below 30 MHz that are authorized to Technician Class operators, only a CW emission type using the international Morse code is authorized. [60] The comments that addressed this situation confirmed our belief that it is improbable that a person who cannot pass at least the very slow speed 5 wpm Morse code examination would even attempt to communicate with other amateur stations by telegraphy. [61] In this situation, therefore, any need to distinguish between stations having Technician Class or Technician Plus Class control operators is subordinate to the need for an efficient identification procedure. We are, therefore, not adopting our proposal. We are, however, editorially revising Section 97.119(e) to clarify the station identification procedure.

IV. CONCLUSION

39. In summary, we have decided to provide a codeless class of operator license by eliminating the telegraphy requirement for the Technician Class. Our objective is to provide an entry level codeless

operator license opportunity to persons who desire to pursue the purpose of the amateur service and who can demonstrate they are qualified to operate amateur stations that transmit exclusively above 30 MHz. In view of the comments received, we have also decided to retain the Novice Class operator license in order to provide an alternate entry level operator license opportunity to persons who desire to pursue the purpose of the amateur service and who can pass a telegraphy requirement in place of the more comprehensive written examination requirement for the codeless Technician Class operator license.

V. PAPERWORK REDUCTION ACT

40. The rules adopted herein have been analyzed with respect to the Paperwork Reduction Act of 1980, 44 USC 3501-3520, and found to contain no new or modified form, information collection and/or record keeping, labeling, disclosure, or record retention requirements; and will not increase or decrease burden hours imposed on the public.

VI. ORDERING CLAUSES

41. For the reasons stated above, IT IS ORDERED that effective February 14, 1991, Part 97 of the Commission's Rules, 47 CFR Part 97, IS AMENDED as set forth in the Appendix. Authority for this action is found in Sections 4(i) and 303(c) and (r) of the Communications Act of 1934, as amended. 47 USC 154(i) and 303(c) and (r).

42. IT IS FURTHER ORDERED that this proceeding IS TERMINATED.

FEDERAL COMMUNICATIONS COMMISSION

Donna R. Searcy
Secretary

Has anyone had difficulty getting packet/Internet mail to KA2RAF?

I have sent him messages to:

KA2RAF@NN2Z.NJ.USA on packet and

ka2qhd!ka2raf@uunet.uu.net on Internet

The internet messages didn't bounce, don't know about the packet mail.
So far no replies.

Hmmm, I just sent a copy of Zmodem to the FCC's 'UNIX guru' in D.C.
I would imagine that there is some manner or method to get mail to them.
I'll ask my contact.

>the window open due to security, and is not thrilled on having me drill holes
>through the wall...
(end of quote)...
had the same problem here... how we solved it was rather simple...

cut a 2"x4"x(height of window if side-sliding, width if up/down)...
drilled that with a 3/4" wood bit to pass coax with connector through, and
sealled with coax-seal or putty or RTV...

now the coax is through, into house... cut a 1"x2" (or pair) to length to
secure the sliding portion of window in place. If a nice tight fit is obtained,
it will be very difficult to break in, and could bne secured further by a
simple latch. I would not recommend screwing them down, for fire exit reasons.

I have also seen people come in under the eaves where the attic vents are,
and then drop the line into a hole in the closet ceiling, but then you have
to get messy/hot.

good luck!

APPENDIX

Part 97 of Chapter I of Title 47 of the Code of Federal Regulations is amended as follows:

1. The authority citation for Part 97 continues to read as follows:

Authority citation: 48 Stat. 1066, 1082, as amended; 47 USC 154, 303. Interpret or apply 48 Stat. 1064-1068, 1081-1105, as amended; 47 USC 151-155, 301-609, unless otherwise noted.

2. Section 97.119(e) is revised to read as follows:

97.119 Station identification.

* * * * *

(e) When the control operator is a person who is exercising the rights and privileges authorized by 97.9(b) of this Part, an indicator must be included after the call sign as follows:

(1) For a control operator who has requested a license modification from Novice Class to Technician Class: KT;

(2) For a control operator who has requested a license modification from Novice Class or Technician Class to General Class: AG;

(1) For a control operator who has requested a license modification from Novice, Technician, or General Class operator to Advanced Class: AA; or

(1) For a control operator who has requested a license modification from Novice, Technician, General, or Advanced Class operator to Amateur Extra Class: AE.

* * * * *

3. Section 97.301(e) is amended by revising the introductory text preceding the table to read as follows:

97.301 Authorized frequency bands.

* * * * *

(e) For a station having a control operator holding a Novice Class operator license, or a Technician Class operator license plus a CSCE indicating that the person passed element 1(A), 1(B) or 1(C), or a Technician Class operator license issued before February 14, 1991:

* * * * *

4. Section 97.501 is amended by revising the introductory text and paragraph (d) to read as follows:

97.501 Qualifying for an amateur operator license.

An applicant must pass an examination for the issuance of a new amateur operator license and for each change in operator class. Each applicant for the class of operator license specified below must pass, or otherwise receive examination credit for, the following examination elements:

* * * * *

(d) Technician Class operator: Elements 2 and 3(A).

* * * * *

FOOTNOTES

---

1. 5 FCC Red 880 (1990).

2. Morse code telegraphy emission types are commonly referred to as "CW," the telegraphic abbreviation of the phrase "continuous wave." See Section 97.3(c)(1) of the Commission's Rules, 47 C.F.R. 97.3(c)(1), for a listing of the CW emission types.

3. See No. 2735 of the ITU Radio Regulations (Geneva, 1979) (hereafter international Radio Regulations).

4. Id

5. The license classes are, in ascending steps, Novice, Technician, General, Advanced, and Amateur Extra. The examinations cover three levels of telegraphy skill. They are 5, 13, and 20 words per minute (wpm). The examinee must also pass written examination elements, depending upon the operator license class sought. See sections 97.501 and 97.503 of the Commission's Rules 47 C.F.R. 97.501 and 97.503.

6. See Notice of Proposed Rule Making, Docket No. 20282, 39 Fed. Reg. 44042 (1974) and Notice of Proposed Rule Making, PR Docket No. 83-28, 48 Fed. Reg. 1855 (1983).

7. Section 97.1 of the Commission's Rules, 47 C.F.R. 97.1, expresses the fundamental purpose of the amateur service in the United States in five principles: (a) Recognition and enhancement of the value of the amateur service to the public as a voluntary, noncommercial communication service, particularly with respect to providing emergency communications; (b) Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art; (c) Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communication and technical phases of the art; (d) Expansion of the existing reservoir within the amateur service of trained operators, technicians, and electronic experts; (e) Continuation and extension of the amateur's unique ability to enhance international goodwill.

8. For example, see comments of Edward P. Murphy at 1, Janet V. Whitney at 6, Gary Worthington at 1.

9. For example, see comments of Jack Bitzer at 3-4, Gordon Girton at 2-3.

10. For example, see comments of John A. Carroll at 1-9, Scott B. Laughlin at 1, and Gordon Girton at 2.

11. For example see comments of O. D. Williams at 1, Michael Barry at 1, Joint Comment of Thomas A. Geis, Georgann M. Geis, and Frederick R. Geis at 1.

12. Notice at para. 5.

13. Id. at para. 15.

14. QCWA comments at 3.

15. ARRL comments at 6.

16. Id. at 2.

17. Comments of NCVEC at 4.

18. Comment of ARIG at 5.

19. Comment of Alan Kaiser at 1.

20. Comment of Michael C. Migliaccio at 1.

21. Comment of Patrick D. Bouldin at 2.

22. Comment of Joel Dunn at 1.

23. Comment of Donald J. Ray at 1.

24. See Section 97..3(c) of the Commission's Rules, 47 C.F.R. 97.3(c), for a description of and the emission types associated with each of these terms.

25. See para 12, supra.

26. The CSCE (certificate of successful completion of an examination) is a document issued by the VEs to an examinee. It indicates which examination element(s) the examinee has passed. See Sections 97.505(a) and 97.9(b) of the Commission's Rules, 47 C.F.R. 97.505(a) and 97.9(b).

27. NCVEC comments at 9.

28. QCWA comments at 1.

29. ARRL comments at 11.

30. ARRL comments at 8.

31. NCVEC comments at 6.

32. Comments of QCWA at 6. To qualify for a Novice Class operator license, an examinee must pass a 5 wpm telegraphy examination and a thirty question written examination. To obtain a Technician Class operator license, an examinee must pass the Novice Class examination elements and an additional written test of twenty-five questions.

33. Above 30 MHz, Novice Class licensees are authorized privileges on the 222.10-223.91 MHz segment of the 1.25 meter band and the entire 23 centimeter band.

34. For example, see comments of QCWA at 8, Phillip David Howard at 3, Conrad Ekstrom at 1, Jay W. Underdown at 3, and Michael R. Burgin at 1.

35. During fiscal year 1990, of the 26,134 persons who entered the amateur service, 2,617 persons did so by obtaining the Technician Class license.

36. Existing Technician Class licensees are authorized all possible privileges above 30 MHz. Below 30 MHz, these licensees are authorized CW emission privileges in portions of the 80, 40, 15 and 10 meter bands, RTTY and data emissions in the frequency segment 28.100-28.300 MHz, and phone emissions in the frequency segment 28.300-28.500 MHz.

37. For convenience, holders of a Technician Class license issued prior to February 14, 1991, and holders of both a Technician Class license and a CSCE for passing a telegraphy examination are referred to hereafter as "Technician Plus CSCE Class" operators to distinguish them from holders of the codeless Technician Class license only.

38. Element 2 is the fundamental written examination required for every class of amateur operator license. Element 3(A) is a written examination concerning the additional privileges of the Technician Class operator

license. See Section 97.503(b) of the Commission's Rules, 47 C.F.R. 97.503(b).

39. ARRL comments at 13. The ARRL proposed that the current twenty-five question Element 3(A) written examination be expanded by five questions and that the current thirty question Element 2 written examination continue as is.

40. For example, see comments of Thomas I. Geiger at 6, William I. Glover at 1, and John C. Thomas at 1.

41. For example, see comments of ARIG at 7, Interstate Repeater Society, Inc., at 3, Michael V. Morrelli at 1, and QCWA at 4.

42. NCVEC comments at 11.

43. NCVEC comments at 8. The current Element 2, 30 question written examination would be reduced by 5 questions and the current Element 3(A), 25 question written examination would be used as in in NCVEC's proposal.

44. See Section 97.503(b) of the Commission's Rules, 47 C.F.R. 97.503(b) and Section 303(1) of the Communications Act of 1934, as amended, 47 USC 303(1). See also No. 2736 of the international Radio Regulations.

45. See Section 97.507(b) of the Commission's Rules, 47 C.F.R. 97.507(b).

46. See Section 97.523 of the Commission's Rules, 47 C.F.R. 97.523.

47. See Section 97.503(b) of the Commission's Rules, 47 C.F.R. 97.503(b).

48. Notice at para. 22.

49. Comments of NCVEC at 6.

50. ARRL comments at 13.

51. See Section 97.519 of the Commission's Rules, 47 C.F.R. 97.519.

52. See Section 97.9(b) of the Commission's Rules, 47 C.F.R. 97.9(b). In the case of a codeless Technician Class licensee who holds a CSCE for only a telegraphy element, the 365 day limitation on operator privileges would not apply because the CSCE does not indicate that the licensee has passed the necessary examinations for a higher class operator license.

53. The data base for codeless Technician Class licensees who subsequently pass a telegraphy examination will be incorporated into the amateur service licensee data base when the necessary capability becomes available.

54. Comment of Mark Forbes at 2.

55. Comments of Elvin D. Lytle at 1, National Amateur Radio Association at 5, Douglas N. Stracener at 3.

56. Comments of ARRL, at 8.

57. In fiscal year 1990, the Commission issued 20,704 Novice Class licenses, each of which required the processing of a license application. The Commission also processed 15,468 applications from Novice Class licensees that upgraded to Technician Class, and 2,617 applications from individuals who entered the amateur service by obtaining a Technician Class license.

58. Comments of National Amateur Radio Association at 7.

59. See Section 97.119(e) of the Commission's Rules, 47 C.F.R. 97.119(e), for details of the indicator system.

60. See Section 97.307(f)(9) of the Commission's Rules, 47 C.F.R. 97.307(f)(9).

61. For example, see comments of Thomas I. Geiger at 6.

I've finished uploading the entire text of the Report and Order in PR 90-55 in three netnews articles.

As I mentioned earlier, I've typed this whole thing in by hand from a xerox of a FAX. I ran the results through 'spell', which caught most typoes, but I can't guarantee that every single number and name is perfect, especially in the footnotes where a smaller font size was used. If anyone spots any typoes, I'd appreciate hearing about them.

Phil

In article <7880397@hpfcdc.HP.COM> perry@hpfcdc.HP.COM (Perry Scott) writes:
>The codeless Tech test is a subset of the question pool for the Novice
>and Tech (FCC elements 2A and 2B). The question pool is published in
>quite a few books. There's even one at Radio Shack. The ARRL also
>publishes the pool. If you can find a local radio club, you can
>probably borrow one of these books for free. I'd lend you mine, but
>I borrowed it from a friend :)

This looks like a good place to drop in a plug that's been seen before...

For those on the Internet, who also have access to a well-equipped Macintosh,
(I expect the overlap is pretty good..) FTP to apple.com, and grab the
Hypercard stacks in /pub/ham-radio. (*test*.hqx) They also have a (non-
Hypercard) Morse practice program for the Mac. The Hypercard stacks are set
up to give you a random test, following all FCC guidelines, out of the
question pool for whatever stack you open (Novice to Extra.) They use the
current question pools for all exams. A wonderful practice tool.

If you can FTP to apple.com, but don't have Stuffit or whatever to unpack
the stacks, give me a yell and I'll try to help you get a working stack...

Gad! Listen to me! A non ham (currently), and I'm sounding like an Elmer!
(perhaps certain facets of amateur radio should take note...)

>Perry Scott / KF0CA

The ARRL Letter
Vol. 9, No. 26
December 31, 1990

FCC Sets Date for Code-Free Tech, Disabled Testing Changes

On Dec. 13 the Federal Communications Commission issued Reports and Orders in the matters of a code-free amateur license and of relaxed Morse code testing for the disabled. February *QST* will carry the complete text of their R&O on the code-free Technician license and a detailed report on new CW testing procedures for the disabled. Here are the highlights:

The effective date for code-free Technician license exams is February 14, and details are mostly as described in the last *Letter*. The R&O does provide insight into the Commission's thinking on the matter. They begin by noting that 70 percent of comments received favored "at least an entry level codeless license." Comments from organizations ranging from the ARRL to the Quarter Century Wireless Association also are invoked, and those of the QCWA were apparently given heavy consideration.

Comments noted by the FCC in opposition to a code-free license were that CW is a superior means of communication that should be retained for all license classes, and that tradition should be maintained. FCC did not fully agree, saying "telegraphy skill is not so essential to proper operation of a station that transmits exclusively above 30 MHz such as to justify turning away otherwise qualified persons who do not possess the skill."

As for specific licensing requirements, the FCC decided not to accept a recommendation that five questions on operating practice be added to the existing 55-question Technician written exam (30 questions from Element 2 and 25 from Element 3A).

Both the ARRL and the National Conference of Volunteer Examiner Coordinators (NCVEC) had recommended that the Commission in effect create a sixth license class, by recording the subsequent passing of a 5-WPM CW test by code-free licensees. Instead, the upgrade to Technician-plus-CW will not involve the issuance of a new license, as described in the previous *Letter*.

Instructors already are gearing up for an expected influx of hams-to-be resulting from the announcement. ARRL's Educational Activities

Department is preparing a new class instructor guide for this new entry point into Amateur Radio. EAD seeks ideas from instructors on content of the new guide, as well as suggestions on how to "mainstream" the new Technicians into our ranks (as well as convincing them of the importance of League membership).

Assuming the code-free Technician license becomes a reality on February 14, amateurs who passed Element 2 and/or Element 3A after February 14, 1990 may now qualify for (or have partial credit toward) the new license. (Element credit is good only for 365 days from the examination date).

And current Novices and Technicians are advised to retain their license (or a copy) to document that they have passed the 5 WPM Morse code examination, for future upgrades.

ARRL Board members will be reviewing the Report and Order--and member reactions--between now and the Board meeting January 18-19, where there will be an opportunity to consider whether partial reconsideration should be sought on the issues on which the Commission departed from the League's recommendations.

CW Testing of the Disabled

Beginning as early as February 14 there are procedures in the FCC Rules for people with certain disabilities to follow who wish to be excused from 13- and 20-wpm Morse code examinations for Amateur Radio licenses. In a Report and Order adopted December 13, 1990, the FCC amended its rules "to exempt from the higher speed Morse code telegraphy examinations amateur operator licensees who, because of severe handicaps, are incapable of passing those examinations."

The exemptions will *not* apply to the 5-wpm tests, since a demonstration of Morse ability is required for operation below 30 MHz.

The primary concern voiced by the ARRL and others was that such exemptions could compromise the entire volunteer examiner program, by putting undue burdens on VEs to make judgements about an applicant's disabilities as well as in asking non-amateur medical professionals to assess applicants.

According to the FCC, the most objections were to a proposed list of disabilities, a list drawn up by the government to indicate a person's "employability." Commenter Alan L. Braun, M.D., NS0B, told the FCC "many persons who have handicaps that prevent them from working do not have handicaps that prevent them from taking a telegraphy examination."

As a result, the FCC will "rely on the integrity and the judgement of the physician who signs the certification to establish, after consulting with the patient, that the person is severely handicapped and because of the disability is unable to pass the telegraphy examination.

"We expect both the examinee and the physician to be honest" the FCC said.

Further, the Commission will "develop a briefing paper for physicians that describes the nature of the Morse code examinations."

"Physicians" will be defined as doctors of medicine (M.D.) and doctors of osteopathy (D.O.), only.

And, at the ARRL's urging, the FCC also will require that an applicant for exemption sign a release, permitting disclosure to the FCC of medical information pertaining to the disability. Revised Form 610s, which will include a physician's certification form, will "contain a warning regarding the penalties for making willful false statements to the Commission in violation of 18 U.S.C. 1001."

In its Report and Order the FCC also acknowledged comments concerning "dilution of the amateur service" and "demeaning" the handicapped, saying in the first case that Morse proficiency had not in the past proven to be a "filter" for the service and, in the second, that all handicapped persons still would be able to choose to take the examinations even if they met the requirements for an exemption.

In the matter of whether a disabled person will be able to give a volunteer examination for an element from which he was exempted, the R&O left to VE coordinators to certify disabled VEs, saying that a disabled licensee could, in some cases, administer exam elements they themselves had not taken.

The Commission used the following example: an Amateur Extra class licensee, acting as a volunteer examiner and having been exempted himself from the 20-WPM examination, still would be capable of administering a receiving exam to another applicant, by the use of taped CW and a written copy of the text sent.

This amendment of the Commission's rules becomes effective Feb. 14, 1991.

COMMENTS BACK 40-METER PROPOSAL

On Dec. 3 the League filed with FCC its comments on the Second Notice of Inquiry in General Docket 89-554, the WARC-92 preparatory proceeding. Supported was a proposal to provide a 300-kHz worldwide amateur allocation, free of broadcasting interference, at 7 MHz. A realignment of the 41-meter broadcasting band to provide a broadcasting band in Region 2 would make this possible. Feedback from League members has largely supported shifting the current amateur 40-meter band band downward by 100 kHz, in exchange for eliminating the present geographical sharing arrangement with broadcasting.

At its meeting November 27 the FCC Industry Advisory Committee agreed to recommend this 7-MHz realignment, adding to a growing consensus on this point among the key players in U.S. WARC-92 preparations.

On 2 meters, the League expressed concern about possible interference to the crowded band should an LEO satellite service be implemented in the adjacent band of 148.0-149.9 MHz, but did not oppose oppose the proposed allocation.

The League did oppose a proposal to reallocate 420-421 MHz for low earth orbit (LEO) satellites, instead supporting an initiative of WARC Informal Working Group 2, which seeks ways of accommodating this new use without adversely affecting existing services.

Finally, the League opposed any reallocation of 2390-2450 MHz that would deny the Amateur Service, and particularly the Amateur-Satellite Service, access to this important band. Recent good news on this front is that satellite broadcasting interests have studied the issue and have concluded that, for the next 15 years or so, satellite sound broadcasting is not feasible above 2.0 GHz; the power requirements at the satellite end are too great. But other interests are still eyeing the band.

The League will file reply comments to the Second NOI on or before the deadline of January 7, 1991.

GROUP ASKS REVIEW OF AM POWER RULE

On Nov. 23, 1990 the Society for the Preservation of Amplitude Modulation (SPAM) filed a petition for reconsideration of the FCC's power limits for AM stations. The Commission denied, on Oct. 13, petitions by the League, by SPAM, and by others, to return to a dc power input limit of 1,000 watts on AM. Since June 2, 1990, the power limit has been 375 watts carrier power output (at 100 percent modulation).

The SPAM petition contends that the FCC has a "hidden agenda concerning ... A3E emission," in that it now restricts experimenters on AM to "a power level four times less than other emission types."

SPAM further contends that power output measurement standards for other modes may not be directly applicable to AM, especially where interference to others is concerned, and that emissions containing a carrier signal should be subject to different standards than carrier-less emissions.

SPAM points out the "adverse economic impact" on amateurs who own "$1,420,000 worth of AM transmitters," noting that most AM gear is American-made and parts to modify equipment to the new, lower power level, may be difficult to obtain.

MONTSERRAT AMATEUR KNIGHTED FOR HURRICANE HUGO EFFORTS

Errol "Bobbie" Martin, VP2MO, has received the British Empire Award for public service. Martin, known to amateurs around the world, worked tirelessly during and after Hurricane Hugo struck Montserrat, his home, in September, 1988. He provided the only communications into and out of the island for several days following the storm, which caused an estimated 100 million dollars (U.S.) damage and left a quarter of the island's 12,000 population homeless.

The BEM award, formerly the Order of the British Empire, is made to both civilian and military persons for distinguished service. Martin was the only Montserratian to receive the award for service resulting from Hugo. It bestows an honorary knighthood on the recipient, who may then be referred to as "Sir."

But VP2MO would prefer you just call him Bobbie. "It's an honor," he said, "but it doesn't put food on the table."

For more information on Martin and on the island of Montserrat see "A Montserrat Memoir," *QST* for March, 1990, page 50.

QSLING: NOT A LOST ART

Farewell to Joan Hushin, KA1IFO, manager of [the ARRL QSL Bureau] the past dozen years. The bureau handles both outgoing and (some) incoming cards; in 1990 some 3 *million* of them. At press time, applications are still being accepted for the position of Bureau Supervisor; see January *QST* League Lines.

As for your incoming cards, please help your call area bureau by ensuring that you have a stock of SASEs on file, with proper postage.

Unofficial word is that first class U.S. postage will rise to 30 cents for the first ounce and 23 cents for each additional ounce, beginning February 3, so please send your hard-working bureau volunteers either additional stamps or money, according to their preference.

DEATHS

Roy Albright, N5RA, of San Antonio, Texas, died December 2. He was 83. Albright was ARRL West Gulf Division Director from 1969 through 1976.

Maurice Carpenter, K0HRZ, of Denver, Colo., died December 17. He was 77. He was ARRL Rocky Mountain Division Director from 1978 to 1980.

George Sterling, W1AE, of Portland, Maine, died November 14 at age 96. Sterling was one of the amateurs who became licensed when licenses were first issued, in 1912. He was the founder of the Radio Intelligence Division of the FCC, which played an important role in World War II and boasts a list of distinguished alumni who are still active in telecommunications and Amateur Radio today. He was the only licensed amateur to be a Commissioner of the FCC, from 1948 to 1954.

Connie Campbell, W1CIE, of Farmington, Conn., died November 26 after a long illness. She was 60, the wife of retired QST Managing Editor Laird Campbell, W1CUT, and also had worked at League Headquarters.

BRIEFS

* The FCC has approved another one-year extension of [Special Temporary Authorizations] (STAs) for selected HF packet stations under automatic control. The extension, until January 4, 1992, is to permit continued experimentation until new FCC rules regarding automatic control of data communications are adopted.

* A federal law concerning FCC responsibility in time of war or national emergency has been changed. As of Dec. 11, 1990, Amateur Radio stations no longer will automatically be shut down in such cases. Now, in either event, all FCC licensees will be obliged to observe whatever orders and instructions the FCC issues in the interests of national security and spectrum use.

* If you're renting or borrowing space on a commercial tower, be advised that [the FCC may be interested in you]. According to the Dec. 17 issue of *Broadcasting* magazine, a two-day inspection of such towers by The FCC in November found 16 per cent (160 out of 1,031) "in apparent violation of safety rules governing their painting and lighting." Each licensee using tower space is separately responsible for lighting and painting, said Richard Smith, chief of the FCC Field Operations Bureau. The Commission has begun tentatively levying fines (mostly $2,000) against each user of towers it found in violation, according to *Broadcasting*.

* On Dec. 13 and 14 the FCC identified 141 radio operators illegally transmitting on frequencies adjacent to the Citizens Band and the

10 meter Amateur band. The two-day effort, involving personnel from all 35 Commission field offices, resulted in fines totalling $147,000.

The unlicensed operations were identified as originating from all 50 states plus the District of Columbia and Puerto Rico. The most active states, according to the FCC, were Florida, California, Michigan, Texas, and Arizona. The equipment in use typically was modified Citizens Band or Amateur transceivers with linear power amplifiers.

Operators included members of organized groups such as World Wide Sideband, Satellite, Alfa Tango, Whiskey Tango, Whiskey Jack, Unidad, Truckers, Eagles International, and Old Timers.

* In response to a request from U.S. Army Brigadier General Wesley B. Taylor, Jr, community commander of the Nuernberg (Germany) Military Community, ARRL has shipped two HF radios for Military Affiliate Radio System (MARS) use by the First Armored Division in Saudi Arabia. "Our present MARS equipment is insufficient for a deployment of this kind," Taylor said, "and we are desperately in need of additional equipment."

The rigs, a Kenwood TS-140S and an ICOM IC-735, were donated in September, 1989, by the manufacturers, for use in Puerto Rico following Hurricane Hugo.

MARS frequencies being used for traffic from the Middle East can be heard on 20.994, 19.532, 14.650, and 14.665 MHz.

MCI Communications Corporation has announced they are providing equipment "to establish 15 new MARS stations" in Saudi Arabia. Since September, MCI has been donating free emergency long-distance telephone service to U.S. military troops in Saudi Arabia through the American Red Cross.

* Lowering the median: A very active Amateur Radio club has [polled its current licensing students] by asking them four questions: 1) Age; 2) Occupation; 3) How they heard about the licensing class; and 4) Why they want to become hams.

35% of the students were age 18 or under, 40% were 19 to 50; and 22% were over 50 (3 per cent kept it a secret). 41% of the class were students, 20% had "electronics related" jobs, and 12% were retired. 75% of the class heard about it from a friend or the newspaper. And their reasons for getting a license ranged from DXing (the most popular response) to Scouting, to "for the fun of it."

* W1AW now is home to plaques listing more than 200 people who contributed $500 or $1,000 to the 1989 renovation of the Maxim Memorial Station. Those contributions amounted to some $180,000. Of course, thousands more contributed smaller amounts, it all adding up to improved service to the amateur community by the station.

W1AW has returned to 160 meters with code practice and bulletins, on 1.818 MHz (CW) and 1.890 MHz (SSB). And, since Jan. 2, the Headquarters station has changed CW frequencies on 10 and 15 meters, to 28.0675 and 21.0675 MHz, to avoid interference to packet operators.

* Nearly one hundred countries have reciprocal Amateur Radio operating agreements with the United States, according to the latest list issued by the FCC (on Dec. 7). HQ has the necessary forms to be used in applying to these and certain other countries for operating permission,

yours for an SASE.

* Nominations are sought for awards to be presented at the next ARRL Atlantic Division Convention, to be held in association with the Rochester, NY Hamfest May 17-19, 1991. "Amateur of the Year" nominees should be from the Atlantic Division and have a strong record of service to the Amateur community. A "Grand Ole Ham" award also will be presented, to someone at least 50 years old and licensed 30 years or more. New for 1991 is the Atlantic Division Technical Achievement Award, available to either an individual or group.

Complete information is available from Richard Goslee, K2VCZ, 24 Elaine Dr., Rochester NY 14623. Deadline for nominations is April 10.

AMATEUR RADIO CALL SIGN LIST

Here are the latest (as of Dec. 1, 1990) call signs issued by the FCC:

District	Group A	Group B	Group C	Group D

I always love it when the League engages in "spin control". The FCC didn't say that they didn't fully agree with these comments, they COMPLETELY REJECTED them as arguments against a codeless license. At least that's how I read the relevant parts of the Report and Order (paragraphs 12-15).

I am very interested in the HamComm program recently posted to Simtel by W.C.Schroeder.

Unfortunately I do not seem to be able to get a good copy. I requested twice the file HC901204.ZIP from SIMTEL. But the files I received do not unzip properly. Is the file on SIMTEL corrupted? I am using Dezip20. I get CRC errors for HC901204.exe and messages about ambiguous code trees for a couple of other files, including the hlp file. I do not think the errors are caused by transmission as I downloaded other files at the same time (also ZIP files, actually) and was able to dezip them properly.

I tryed to contact the author, but the address I use must be wrong for my mail bounces.

If any one out there has a good copy of the program, could you send
me a brief note? I shall then request the file from the closest
site.

Many thanks in advance.

Hi!
I had the same problem when I lived in a student's apartment. I wanted to get three coax cables out of a window. I did not want to drill any holes in the wall because it was not my house. Looking through a magazine describing microwave transmission lines solved the problem, though!

The article in the magazine described a "coplanar transmission line" It consists of one flat conductor surrounded by another two conductors:

```
                          ____________  ____   ____________
                         /           / /    / /           /
                        /           / /    / /           /
                       /           / /    / /           /
                      /           / /    / /           /
                     /           / /    / /           /
                    /           / /    / /           /
                   /           / /    / /           /
                  /           / /    / /           /
                 /           / /    / /           /
                /           / /    / /           /
               /           / /    / /           /
              /___________/ /____/ /___________/
              |___________| |____| |___________|
```

The signal is fed to the middle conductor while the surrounding conductors are grounded. (Now, this looks like a cut-open coaxial cable.... Interesting!)

In microwave applications the conductors are etched on a PCB. I cut strips from a sheet of brass and soldered them to two PL 259 (?) connectors.
Like this:

```

      Nut&Bolt
        |_| |_________________________________....
```

Rotated 90 degrees:

```
         _
        | |
        | |
        | |
        | |
________| |_
|       | | |
|       | | |
|       | |_|_____________________________________________________
|     Nut&Bolt___________________________________________________
|       | | |
|       | | |
|_______| |_|
        | |
        | |
        | |
        | |
        |_|
```

The transmission line is now 50 Ohms, unbalanced, exactly as the coax
you connect it to. Great! The only problem i had is that when I closed the
window, the transmission line got bent like this:

```
    ---------------------
                         |
                         |
                         |______________________
```

But it worked.

Now you are of course anxious to know how to calculate the dimensions
for the parts. Well, I must admit (embarrassing) that I did not use my
knowledge in electromagnethics to design the transmission line; I cut
the pieces and mounted them at the distance that gave the lowest SWR when
I connected the line between a SWR meter and a dummy load.

I used a sheet of 0.5 mm brass. The inner conductor is 4 mm wide, and the
outer conductors are about 10 mm wide. They are separated about 1-2 mm. To keep
them from touching each other I insulated the inner conductor with tape. To
keep the construction stable I put a piece of wide tape along the whole line.

I used the transmisoin successfully on 2m with my handheld, and on HF using
about 100W output.

And, yes, the window frame was made of wood. At my present apartment the window
frames are made of aluminum (?), so I don't know if I can use the lines there.

I hope you can understand my "drawings", and that you will be able to make
a few lines yourself! Please tell me if you have any problems, or, of course
if you succeed! (This applies to all other fellow net-hams too!)

```

While traveling in Japan recently, I bought an ICOM IC-R1 Communications Receiver. This is a handheld scanning receiver about the same size as a HT without the external battery case. The specified frequency range is 2-905 MHz but it will tune 100 kHz to 1300 MHz. It is a really neat unit. I have been having fun listening to police calls, ham radio, etc. but I have a bunch of questions:

1. Can anyone supply an English instruction manual for this unit? I have only the Japanese manual and there are some functions I have not yet figured out. ICOM America sent me a form letter stating that they will not supply the unit or the manual in the U.S. at this time.

2. Can anyone supply a list of frequencies of interesting things to listen to in the Bay area, particularly San Jose and Santa Cruz areas?

3. How could I construct a simple antenna for listening to HF frequencies? (the unit comes with a flexible VHF-UHF antenna). Should I build an active antenna? (I saw a Ramsey kit for about $20)

4. Can anyone supply a list of interesting HF frequencies which I might be able to pick up with this receiver and the above antenna? The tuning resolution is 500 Hz and demodulation modes are AM, FM, Wideband FM.

5. Can anyone recommend a good book for introduction to amateur radio?

Thanks in advance for any help.

SOFTWARE DEVELOPERS WANTED

HR AMSAT NEWS SERVICE BULLETIN 005.01 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 5, 1991
TO ALL RADIO AMATEURS BT

AMSAT looking for Volunteers to Develop PACSAT Software for Various Computers

AMSAT hardware and software development runs entirely on the volunteer efforts of its members. People like Harold Price, NK6K, Bob McGwier, N4HY, Tom Clark, W3IWI, and others have volunteered thousands of hours over the past 22 years to make the Amateur Satellite Program what it is today. Unfortunately, AMSAT has yet to perfect a cloning process for people like Harold, Bob, and Tom (some might argue after having met them, this is a good thing!). However, the lack of Harold, Bob, and Tom clones means the engineering development efforts are resource limited . AMSAT is constantly in need of individuals who feel that the Amateur Satellite Program is important and feel that they have something to offer in the area of spacecraft development.

At present, the PACSAT Protocol Suite (PPS) is only available for the MS-DOS IBM (and clones) platform. The engineering team chose to develop the PPS for the IBM for the simple reason that that is what they have at home. It is not an attempt to exclude anyone from using the Microsats, it is simply a matter of project prioritization. There is an immediate need for individuals who are fairly competent software developers who have an interest in porting the PPS to other computing platforms. AMSAT recognizes that users of the satellites employ a number of different types of computers for tracking and other Ham Radio applications, however, until someone steps forward to develop software for the other various platforms, only people who have access to MS-DOS machines will have access to the PACSATs and UO-14.

If you are interested in such a project, do not be frighted by the thought that you will have to whip this up from scratch and in a vacuum. Harold, NK6K and Jeff G0/K8KA, have published an exhaustive spec on the PPS and you will have access to members of the AMSAT Engineering team who can provide additional information during the development/beta test phase of your project development. The ultimate goal is to provide the AMSAT Software Exchange with executable PPS code for your favorite machines. Besides having your name and call sign on the copywrite notice, you will have the satisfaction that you personally have contributed to one of most exciting aspects of Amateur Radio. Think it over. If you are reading this on a MacIntosh, Amiga, Atari, C-64, or ZX-81 and feel confident enough to take on this sort of a project, contact Area Coordinator and AMSAT's new Software Exchange Manager: Roy Welch (W0SL) 908 Dutch Mill Rd., Manchester, MO 63011 (or call (314) 391-1127 after January 14, 1991). The only way anything is accomplished by AMSAT is when people like you step up and sign up for a piece of the action.

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 005.02 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 5, 1991
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule

Happy New Year! from the AMSAT Operations Team

AMSAT Operations Nets are planned for the following times.Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date	Phs	mode	UTC	NCS	Alt.	U.S. day
13 Jan 91	99	B	0500	WB6LLO	N5BF	Saturday
19 Jan 91	210	B	1445	WB9ANQ	KA5SMA	Saturday
26 Jan 91	211	B	1830	WA5ZIB	WD0E	Saturday
03 Feb 91	0500	B	0107	N5BF	WB6LLO	Saturday
09 Feb 91	1430	B	0212	KA5SMA	WB9ANQ	Saturday

John Champa (K8OCL), AMSAT-NA Executive VP will discuss AMSAT participation in advanced projects such as the World Space Foundation Solar Sail, Lunar olar Prospector, and SEDSAT (supported by the Detroit Oscar User's Group) during he net session on 13 January 91.

Roy Welch (W0SL) will discuss his new job as AMSAT Software Exchange Manager and what this means in terms of improved software user support during the 26 January 91 session.

It is the intention of the Operations Net management to have guest speakers approximately every other week to provide up-to-the-minute information on topics of interest (such as Microsat ground station software, AMSAT Software Exchange, and WARC 92). As guest speakers and topics are confirmed they will be published in ANS.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

SB ALL @ AMSAT      $ANS-005.03
NEW AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 005.03 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 5, 1991
TO ALL RADIO AMATEURS BT

The new winter transponder schedule for AO-13 is as follows:

 Mode-B : MA   0 to MA 165 | <= If eclipses over-drain battery in
 Mode-JL: MA 165 to Ma 190 |    Jan 10 - Feb 06, B-OFF MA 20-65
 Mode-LS: MA 190 to MA 195 |
 Mode-S : MA 195 to MA 200 | <= Mode B is OFF; no swishing!
 Mode-BS: MA 200 to MA 205 | <= QRP on BS please.  High power
 Mode-B : MA 205 to MA 256 |    wipes out mode S experimenters.
 Omnis  : MA 240 to MA  30 |

This schedule is expected to span from 28 December 90 to 25 March 91

The command team requests that you make a specific effort to use QRP on Mode B
between MA 200 to 205.  This is specifically to help those people who are
experimenting with Mode S.

During the Winter, the worst Sun angle (11 March 91) will be -27 deg,
resulting in 89% illumination.  AO-13 will experience eclipses by the Earth
from 11 January 91 to 6 February 91, the longest being 82 minutes (MA 32-53).
If battery drain is excessive during this period of time, it may result in
Mode B being turned off from MA 20-65 until 6 February 91.  AO-13 will
experience Lunar eclipses on 16 March 91 (50%) and 14 April 91 (23%).

Magnetorquing operations are complete and the resulting spacecraft attitude of
AO-13 is:

               BLON = 209.5  and  BLAT = 0.7  for 31 December 90

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to
support Mode-B transponder operations. The transponder may be used, carefully,
at all points of the orbit except MA 254 - 006 when eclipses occur.  If beacon
or transponder signals show signs of FMing, users should cease all transponder
use immediately.  An APPROXIMATION of the spacecraft attitude for AO-10 is :

               BLON = 0.0    and  BLAT =  2.0  for 19 January 91

/EX

Seeing the recent discussion on ARRL's feelings on no-code license, i was
wondering - what proportion of US hams are members of ARRL?   Here in the UK
the membership of RSGB is some 50-60%% of license holders. I can dig out
the precise figure if anyone is interested.

rec.ham-radio.packet:3355

This is a formal call for votes for the proposed reorganization of rec.ham-radio.*. The discussion period started on December 4, 1990, and has run for just over the required 30 days (extended from the original ending time of 31 December 1990 due to the Christmas and New Year's holidays). Please read this entire posting before sending in your vote; the ballot to be used is at the end.

THE PROPOSAL:
=============

The following groups are to be renamed:
rec.ham-radio   => rec.radio.amateur.misc
rec.ham-radio.packet => rec.radio.amateur.packet
rec.ham-radio.swap   => rec.radio.swap
Groups will be renamed by creating the replacement group, asking site admins to alias the old group to the new one, and rmgrouping the old group after traffic in it has died down, hopefully about a month later. This method has been shown to work in other hierarchies.

The following groups are to be created:
rec.radio.amateur.policy
This group is intended to contain any and all discussion about policy issues pertaining to amateur radio, including, but not limited to, rules, regulations, laws, and legal actions by and against amateur radio operators. This group is to be unmoderated.

rec.radio.cb
This group is intended to contain discussions related to Citizens' Band radio. This group will be unmoderated.

RATIONALE:
==========

1. Why move the groups at all? The primary motivation is to make it easier for interested people to find newsgroups related to ham radio. The rec.radio hierarchy was created after rec.ham-radio (net.ham-radio before the Great Renaming). It is an inconsistency in the namespace to have groups for similar purposes separated from each other, and that makes it harder for new users to find the desired groups. Further, this allows a change from ham radio to amateur radio (see next topic).

2. Why .amateur instead of .ham? It has been pointed out in discussion that "ham radio" is primarily an American term, and carries little meaning outside the US. In addition, there are negative connotations attached to "ham" that don't apply to "amateur". Some confusion also exists in the public mind about just what a "ham radio operator" is, as evidenced by the occasional "ham operator jams aircraft frequencies!" when the person in question has never been a licensed amateur radio operator.

3. Why a .policy group? A significant part of the traffic in rec.ham-radio is concerned with issues of policy. This includes substantially all of the flamage, which has in the recent past included such subjects as whether or not it's legal to order a pizza via an amateur repeater, the proposal to add a class of license that

does not require knowledge of the International Morse Code, and the legality of modifying amateur equipment to transmit outside the amateur bands. The new group is intended to move the flames and the long discussions that never seem to get anywhere out of the main group.

4. Why use the name .policy, instead of .rules, .regs, .regulations, etc.? The group is intended to contain any and all discussion about any policy issues pertaining to amateur radio. This includes not just rules and regulations of the FCC and other national regulatory bodies, but also laws affecting hams (such as the infamous New Jersey scanner law), lawsuits over nuisance issues, antenna ordinances, frequency coordination and band planning, and the like. .policy is the best name that has been suggested for the group out of many possibilities.

5. Why not a .tech group? There are two reasons for this one. The first is that there's more to ham radio that's non-inflammatory than just technical discussions, and the object of a new group is to move the flames, not run away from them. A .tech group would leave those of us who are interested in more than just technical discussions, yet not in the seemingly endless legal discussions, left to wade through the flames. Second, Brian Kantor, who maintains the info-hams mailing list, has said that info-hams will continue to gateway rec.ham-radio (and, presumably, rec.radio.amateur.misc) only, and moving the technical postings off would deprive those on the mailing list.

6. Why create a .cb group? There is currently no place for Citizens' Band radio discussions explicit in the hierarchy. These postings currently wind up in rec.ham-radio, where they tend to generate flamage all out of proportion to their volume.

THE MECHANICS OF THE VOTE:
==========================

The voting period will run from Monday, 7 January 1991 until Monday, 28 January 1991. Only votes received during that period will be counted. Each proposal is a separate vote, and must be voted on separately under the Guidelines for Group Creation (which have been applied to renames as well in the past).

Please edit and send in the ballot below. Each ballot will be stripped of all but the From: line and the lines containing valid votes by an automatic process; I won't see any comments included. No individual acknowledgments will be mailed. Votes will be acknowledged en masse in a posting on Thursday, 18 January 1991, and complete vote results will be posted on Tuesday, 29 January 1991.

For each proposal, indicate your choice of a yes vote or a no vote by placing a Y or N, respectively, at the beginning of the line. The first character on the line that is either a Y or an N (case doesn't matter) will be counted as your vote on that proposal. You may abstain from any particular vote by deleting the line entirely from the ballot. An invalid

```
line (one not containing a Y or an N before the "Proposal #n:" tag) will be
treated as an abstention, as well. Mail the completed ballot to me at
this address, jmaynard@thesis1.hsch.utexas.edu, with the characters "VOTE"
somewhere in the Subject: line. (Again, case doesn't matter.) Replying to
this message with your newsreader's mail reply command ("R" in rn, readnews,
vnews, and vn; I don't know nn's commamd) will work fine. Votes posted to
the net will be summarily ignored and may earn the poster a free flame from
the net.police.

THE BALLOT:
===========
 ?   Proposal #1: Rename rec.ham-radio to rec.radio.amateur.misc
 ?   Proposal #2: Rename rec.ham-radio.packet to rec.radio.amateur.packet
 ?   Proposal #3: Rename rec.ham-radio.swap to rec.radio.swap
 ?   Proposal #4: Create rec.radio.amateur.policy
 ?   Proposal #5: Create rec.radio.cb

Anyone with experience with Comet (sold by NCG and others) antennas and
diplexers? I have bought two diplexers for my rptrs to be moved
to a new tower site and they will help in saving me from having to use heliax
I have..but after looking inside of them, I am wondering if they will do the
job...The IFR A8000 at work shows they do what their specs say they will...
but I hva enot tried the antenna or diplexers in real service yet (waiting for
the wx to clear!)..any comments, etc would be appreciated..

GB> used to remember in the 50's and 60's always hearing high school and
GB> college age kids on the ham bands. I don't think there is anyone
GB> younger than 35 on the local ham bands, and I do not recall hearing very
GB> many youthful voices on 20 40 or 75 either.

GB> I want to personally elmer in a SLEW of new ops, and so should the rest
GB> of you.

GB> At least here on USENET, there has not been the sour grapes doom and
GB> gloom griping.

GB> "Ham radio will become like CB"

GB> Well I tell ya folks. Listen to 14.313 and then come to Marquette
GB> Michigan and tune in 27.275. Compare the two. Then say "Boy would it
GB> ever be a good thing if it *DID*"

Hi this is a call from across the border. About 10 years ago there was an influx of "CBers". Guess what guys these people turned out to be the best darned operators around. Several of them including myself are still active but several of them gave up .Due to lack of interest in the scope and subjects or lack there of being discussed on the Amateur Bands. Can we blame them. No! Either we keep the hobby alive with fresh ideas and operators or even a transfusion wont help.The average age of the Amateur Radio Operator has gone up by 10 years over the past 5 years in both Canada and the U.S.A. We need the younger operator to keep our hobby a viable,going concern. No code licencing may achieve that objective. If not we are going to lose band space etc! It really is a case of use it or lose IT!

I recently read something on USENET (Via the HAM-TECH echo) by a guy who addressed apparent rumors that the ARRL will appeal the no-code tech license. The poster talked to someone from the ARRL, the Mid-Atlantic coordinator, if I read the posting correctly. This coordinator mentioned three possibile difficulties with the no-code Tech:

1. The Code/No-code battle. It was mentioned that this debate has split ham radio, and that if the no-code goes into effect, it'll damage the hobby (because of the split).

2. If more new amateurs go to 6 meters (seemingly underutilized), they'll cause (more) TVI to channel 2.

3. The Novice privileges on 220 were intended to get more spectrum in use up there, which as most of you know is endangered by commercial interests. By giving 2 meters to new no-code techs, the 2 meter band may well become overloaded.

My response:

1. The ARRL seems to be saying that, because some old hams are bitter about no-code, no-code should not be implemented. I say (no offense) to the OF's--TOUGH LUCK! Life is but constant change, and new folks should not carry the cross just because of progress. The ARRL MUST get new blood if it is to survive, and if that means that a relative few will be unhappy and bitter, so be it. Most people on this echo accept the ruling, anyway.

2. The TVI thing. The ARRL is almost saying that the CW test is a "filter" that will keep all these people off 6 meters. It's ridiculous--how many people even operate in that band, anyway?

3. Band loading may well be a concern, but the ARRwould do better to take a proactive approach, and explain the numerous benefits of 220, 440, 1270, etc. I've been told on another echo, that by commercial standards, 2 meters is not heavily used. In any event, the ARRL should speak to all hams on this, instead of asking the newcomers to bear the "sins" of their elders.

I'm infuriated; If the ARRL does appeal, then I'll NEVER join, for then the organization will not serve MY interests (which are as valid as any old farts'). If they appeal, you'll hear Wayne Green talking about this one from now until Hell, for sure!

In QST, Earl Schwittek advertises a board that will do the job. It is ~ $120 assembled and tested and much less for bare board, schematics, and some documentation. This board is very straightforward and comes with software to support it. In its native format, a game port is required though you can get around this as well.

The board consists of several simple pieces:

First, there is a low Q bandpass filter around 2400 Hz. Low Q because it must do things like not filter off the modulation side bands which include the sync tones (even though no software but mine apparently uses the sync signal, I'd like to be proved wrong). It must also pass Meteor (Russian weather birds) imagery. The Meteor's do not have their tone at 2400 Hz.

Following this is a standard envelope detector. This is a full wave rectifier and a low pass filter. The APT handbook says the image carries information to 1400 Hz so a well designed system could use 1400 Hz. In analog practice, it is difficult to get this so most designs have this analog filter cutoff at a lower frequency. The pictures are good anyway but some small amount of resolution is lost.

In my strictly DSP approach, I have an FIR which cuts off at 1200 Hz and stops shut at 2400 Hz. It is 44 dB down at 2400 with less than 1 dB of ripple in the passband (how I LOVE DSP).

The output of this lowpass filter is sampled under software control and the digitized samples are sent through the game port.

One of the nice features of Earl's hardware is in addition to the APT demod, it contains a two filter, slicer discriminator. Two bandpass filters, one over the low portion of the HF wefax tones and one with passband over the high portion of the HF wefax tones, are fed the input signal. The output of each is full wave rectified. One is fed into a summer directly, the other is fed through an inverter first and then to the summer. The output of the summer is fed to the same low pass filter talked about above. Think for a moment about what this does. If the tone is low, then the lower filter output should have a higher amplitude than the high filter output, so the signal will have an average value that is less than half scale. The higher the frequency, the more the high tone filter takes over. If all this is well designed, and the two filter outputs carefully equalized, and each has similar responses, you get a fantastic S shaped discriminator with linear response in the region you care about. Once again, the low pass version of this discriminator output is fed to the A/D and from there to the computer. Since you are writing your own software, this hardware might be particularly suited to your needs.

I am very familiarly with it since as I have just mentioned, I have emulated its functions in software for a DSP thingy. There have to be several others like this, it is just this one I am most familiar with.

Hope this was of some help to you.

That is not true.

It includes a modification of the TAPR PSK modem for which a license has been granted. The legal details have been worked out between TAPR and the Japanese ages ago. There was some quid pro quo of you take our design, tweak it as you will, and give us copies, artwork, etc. In return, you can market it as you see fit and license it to whomever you please. The intellectual property that myself, KA2MOV, and KB2CST have in it are a 68HC11 design, a redone analog front end, including an AGC, and a major code effort to do some DSP in the 68HC11. We do integrate and dumps in the 68HC11 of the analog signal. It is a 2 dB win over the hard limiting design of the TAPR original without the AGC. The AGC is a big win in its use for copying AO-13. Yes, AO13. One of the modes for the modem is to change loop constants, and to run a clock recovery for the manchester data coming from AO-13. This is sent out in a format compatible with P3C.EXE, which is available from AMSAT-VK and PROJECT OSCAR. The royalties come in because we put it in a form that was commercially useful, made major enchancements to it, and for less than the cost of a TAPR PSK kit plus G3RUH AO-13 demod you get both, assembled and sometimes tested by PacComm ;-(.

According to several who use it, it outperforms even the infamous AFDEM in copying AO13 and its weak signal performance on PSK is quite good. Both the TAPR royalies ($2 per) and mine are a joke, we did it to get it into the amateur radio community in a commercial package. If Gwyn sells 1000 (not there yet), we will have our investment paid off.

I don't know why I feel defensive about this, but I guess I didn't care for the `tone' of your question.

Bob

I knew I'd get ya Brian B--)

Actually more crowded conditions should stimulate
both DSP and SS solutions to improving CW reception. It should be possible to
operate CW underneath SSB and digital modes using current DSP technology to
pull a very narrow carrier out of the QRM and synthesize an ear copyable audio
output. My DSP engineers tell me they can do this now with a few hundred
dollars worth of hardware and some programming. The first stage would be to
build a processor that crunches the audio output of your current rig. A
sort of glorified audio filter. If enough of these units sold, rig manufact-
turers would get interested in adding the DSP enhancer to the earlier IF stages
of newer rigs. This same process has brought about the inclusion of CW keyers
in the newest rigs. KENWOOD, ICOM, YAESU..they all have them so there must be
a demand.

This should make us both happy. More spectrum for the digital modes as the
demand explodes, while at the same time allowing CW OPs to work anywhere
in the spectrum regardless of QRM caused by crowded band conditions.

Maybe we can all learn to live together in peace and harmony....

Naaaaaah

Happy New Year! AA6PN

Not if you consider that just getting a 5 wpm CSCE authorizes Novice band HF
privileges.

Actually, as a no-phone novice I used to work 40 M CW every night. It was most
painful but it was the best training for copying CW there is. After years of
duelling with the AM broadcasters I found I could copy almost anything through

the most horrendous QRM. There are "gettoes" of quiet spots between the AM stations that the same regulars find and occupy. I can still work old friends on 40 from back east where I was first licenced who, like me, still slip into the holes to see what's happening. And there are lots of new hot novice and tech CW punchers with fists that jump right out of the noise. The beat goes on.

>Hey Dick, even poor old dyslexic Morse confused me has worked 40 meter
>CW. If you can hack that, you can handle *any* interference from puny
>ham transmitters. Besides, you can catch up on the *straight* news from
>Radio Moscow between beeps. :-)
>

Believe it or not I still do this. If you work up tight under RM close to 7.148 you can switch back and forth from AM and CW mode and listen to the Russkies while waiting for some action to show up on the band. I can't believe I still do this stuff but its still fun after all these years.

Well it ain't pretty but it works...

I am interested in operating from the Caribbean this spring.

QST has a couple of ads for locations in VP5 and ZF2 which have stations set up for your use. Has anyone given these places a try?

I would appreciate any advice on operating locations with or without stations set up. Aruba is of special interest.

Hamming would be a part time activity, with relaxing on the beach and windsurfing given main priority.

thanks in advance, tom - k1um

I'm hoping I might be able to get some information here, because of the similarity of TDD and RTTY operation. For those that don't know, a TTD is a terminal and modem for a deaf person to communicate over the telephone. It uses 45.45 baud Baudot code, using a half-duplex Weitbrecht modem with space at 1800Hz, and mark at 1070 Hz. The tones are transmitted only when a character is being sent.

I'm trying to set up a friends Mac so she can use it at a TTD. She has a TTD, but because of its size and shape, it's difficult and painful for her to use. I'm hoping someone in this community may have some useful information about this.

BTW, cost is an issue. A "modem" that apparently does the translation to ASCII is available for $350.

Thanx, and 73,
doug

My father (who is disabled) wanted a scanner. We got him one for Christmas, figuring that it would give him something to do. I know nothing about this type of thing ... it is a programmable scanner ... and I would really appreciate any information concerning good frequencies to listen to in the South Western PA area (Pittsburgh, Indiana, Kittaning, Punxsutawney, Butler, Dubois, Monroeville, Blairsville, etc.). I apologize if this is the wrong newsgroup ... and thank anyone in advance for any assistance. Please post to this group or EMAIL me directly.
Thanks Again!

I believe that the statement about the radials being the same length as the vertical element is incorrect. The ground radials should be 10% *longer* than the vertical element. If you are building a 1/4-wave ground plane for 27 mHz, the length of the vertical element should be around 108". That makes the radials

come in around 119". I'm no expert, but that is what I seem to
remember reading about them.

I also seem to remember something about making sure the radials
are "drooping" at a 45-degree angle, because that makes the ground
plane closer to the desired 50-ohm impedance.

I have obtained a copy of the satellite tracking program, orbit23. As there was no documentation, plus the fact that I'm unfamiliar with everything, could someone out there familiar with the output explain a few things to me?

1) What does "phase(360)" mean?
2) How does one get it to output to printer?
3) Do the lat,long correspond to the setting circles on a scope?
4) Is it possible to input parts of hours for start time; i.e. 1:30 UT, instead of 1 UT?
5) Will it accept input for days as a fraction; i.e. .25 for a quarter-day, etc?
6) Is it possible to use a compass and quadrant with the Az,El info? (since I'm more used to these instruments!).

Thanx for any assistance anybody can offer!

Actually I wasn't whining about anything. The fact that you DO receive credit for past exams is a GOOD thing. In my post on the subject I was just saying that if instead of going up one class at a time you qualify for a higher-class license in one sitting, you will be tested on band restrictions that will never apply to you. In other words, if an unlicensed person goes in and passes all of the tests to get an Advanced Class license, they will be tested on band restrictions for Novice, Technician and General.

It isn't necessarily a bad thing to know, but it is a side effect of the modular exams that you may be tested on rules that will not apply to you depending on what elements you pass.

I am NOT suggesting we change that. Better for them to know too much than too little! :-)

I have been following this thread and have some thoughts. First, I'm
not taking a stance on code/nocode. I'm just wondering why these people
who seem to believe STRONGLY in what they are doing, and have taken a
position (sending in their VEC credentials as a protest) are assinine?
Not doing what you believe in is hypocritical, to do nothing is apathy,
and if you don't agree with Mike you're assinine? Hmmm, seems like a no-
win situation.
I applaud anyone who has the guts to do what they believe in, even if it
does not necessarily agree with my own viewpoint.

>on this issue and out of touch with "real" hams.
>...

I sent email to the ARRL mci address (and cc'd everybody that someone
else had as well) on Tuesday, and got a reply today (Thursday).

I have emailed back asking if he (K1ZZ) minded if I post the email
he sent. He has not replied yet (obviously), but I pretty much expect
a positive reply (I also took the opportunity to suggest to him that
ARRL should get a usenet feed, and offering to help them do it).

In any case, I will summarize: the ARRL does not have any plans to
petition for reconsideration (yet). Such a decision will be made
during the meeting Jan 18-19. Write your directors to tell them
what you think.

So, there you have it, and only one hop away from the horses mouth :-)

Callsign Project Update:

I got the tape from the NTIS the day I got back from vacation.

I've finished most of the 9-track tapes (easiest media for me to do this year, as opposed to carts which were easier last year!). We should have them in the mail tomorrow (Friday Jan 4).

Once I get the carts better organized I'll be doing them as quick as I can. Hopefully no later than middle of next week.

73, merry Christmas, and very happy new year!

(or is that newt ear? nude ear? new dear? Oh dear! :-)

It seems that you have neglected to consider possibly the most important feature of all: how well does it work (as compared with other rigs generally available.)
The recent Yaesu line seems sadly deficient in receiving quality and servicability -- I admit to having been at one time a Yaesu owner, and I have one comment: Never Again.

```
Recommend seeing some of the comments and comparative measurements by
N5AR, DL1BU, and QST Feb 88.  Would seem to me that the predominant
"Asian
lines rank Icom, Kenwood, Yaesu, with the Ten-Tecs as good as the Icoms.
This for general receiver performance.  On durability and serviceability
the T-T's are about 3 orders of magnitude ahead of the others.
The combination of PLL general coverage and acceptable ham-band performance
in one box is asking a little much --- and only one manufacturer
is willing publicly to address the problem:
Ten-Tec's ads put the Omni V and Paragon side by side, with generally
identical appearance and features and price, but with their comment
that if you must have general coverage, buy Paragon, but if you want
top ham performance, Omni.  My own service experience with T-T has
been no b-s assistance from the guy who answers the phone, overnight
receipt of needed components, and flea-market size bills.
On the other hand, don't write off Drake stuff.  None available new
any more, sadly, but it'
it's very very good stuff.
Collins likewise.

OK...someone want to explain how those of us who aren't EE technonerds with
serious, high-level education in the higher realms of mathematics and the
theory of signals can do useful things digitally?
```

The impression I got from talking briefly with N4HY is that seriously heavy theory is involved in even thinking about playing with DSP. The comparison I've drawn after considering the question is that the equivalent level of knowledge for a digital logic hacker is knowing how to mask and dope silicon wafers that are eventually built into gates. Is it possible to have the gates premade, so I only have to worry about wiring them together?

This gets even worse for a non-computer weenie...I, at least, am comfortable with the idea of writing assembly language code. Joe Ham who's not a systems programmer has an additional layer to penetrate.

One of these days, there will be a DSP device in my packet station. (The thing will be doing useful work when I'm not playing with it.) The question is, will I be able to hack on it without earning 30 credit hours?

#
#By using a piece(s) of wire, you wouldn't even need the PTT.
#
#Perry "chewing gum and baling wire"
#KF0CA

I did use CW once on 2 meters for just this reason. I was chatting with an old friend when the mike audio lead broke inside the plug attached to the transceiver. I apologized for the abrupt cessation of the conversation using just the PTT to key carrier to my CW literate friend.

I am grateful for the no-code license option. My wife (who is quite

capable of passing the written exam) will finally be able to share the use
of my rather substantial investment in Amateur Radio. Even though I have an
Advanced Class license (WA6SMN), I couldn't care less about operating on HF
or using CW. High speed digital networking is what really piques my interest
in the hobby. Yakking on a voice repeater is usually boring....the less
educated members of the community seem to feel the need to jam any sort
of technical discussion. Maybe getting a few more EE's on the air will help.

When I was in college a ham buddy of mine and his girlfriend came around
one day. I asked them what they had been up to lately, and my friend
said his girlfriend had learned the code "this morning". When I expressed
disbelief, he tested her on the spot. She was still a little weak on
a couple of the letters, as I recall, but she basically had all the
letters and numbers.

Aren't there some building-block-type DSP chips that do fairly
elementary things and can be treated as black boxes?

If not, there ought to be. There's a ready market...

One-tube CW transmitters would seem awfully complex, too, if you
had to derive them from basic physics!

[excellent rebuttals to an ARRL coordinator's beefs with no-code.
  Here are the ARRL coord's beefs again, with my own rebuttals   ]

>1. The Code/No-code battle. It was mentioned that this debate has split ham
>radio, and that if the no-code goes into effect, it'll damage the hobby
>(because of the split).

Yeah, like we shouldn't let blacks in our schools, because it'll just cause
racism. :-|

>2. If more new amateurs go to 6 meters (seemingly underutilized), they'll
>cause (more) TVI to channel 2.

All amateurs except novices are allowed on 6 meters, so the only way this
argument holds up is if we generalize: avoid having any new amateurs
because they might use 6m and mess up channel 2.

That's great. The ARRL is trying to keep people OUT of the hobby.

>3. The Novice privileges on 220 were intended to get more spectrum in use up
>there, which as most of you know is endangered by commercial interests. By
>giving 2 meters to new no-code techs, the 2 meter band may well become
>overloaded.

The 2m spectrum is poorly managed, not overloaded. Ask the commercial
services that would love to get their hands on it!

Oh well, I'm not saying anything that hasn't been said before ... I am
24 now. When I was 20 I went to a local ham club meeting. The next
youngest person was 35, then 50+ all the way. Is amateur radio the
exclusive old-timer's hobby, or are we young hobbyists welcome? I
get the idea that in fact we are not welcome. I've got a license but
I've been bootlegging because it's a better way to talk to people who
are genuinely interested in radios! Don't quote me on that!

Jay Maynard and others have brought up an excellent point: there is very little knowledge in the ham community of DSP and the theory behind it. However, in the innaugural issue of Communications Quarterly, there's a very good introductory article. I'd suggest Jay read that for a start, then post his questions about it to the net. We could all benefit from the responses.

.

I don't think there's any way to understand the finer points of DSP without *some* math being involved, but the basic principle is pretty simple. You take "strobe photos" (called "samples") of the input signal at regular intervals (called the "sampling rate") and convert the voltage you measure to a binary number (using an A-D converter). Then you do math :-) It doesn't have to be complicated math, although it can be. What you do could be as simple as displaying an X-Y plot of the voltage values against the sample number. Sort of like an oscilloscope. You could even send the samples to a D-A converter and regenerate the original signal if you wanted.

Texas Instruments has been running some ads lately offering a set of 3 DSP applications handbooks wich might be of interest. A call to your friendly local TI sales office might be in order...

This isn't about code, or no-code, or appeals, or such.

Grey writes:

> I'm infuriated; If the ARRL does appeal, then I'll NEVER join, for then the
> organization will not serve MY interests (which are as valid as any old
>
> .... and so on.

This reminds me of the turtle who left the bar to go home and get his umbrella. After several days, as his companion was finally ready to give up and go ahead and drink his friend's beer, the turtle replies from the doorway, "If you drink my beer, I won't go get the umbrella."

Well, Grey, if you were going to join ARRL, you WOULD have, it seems to me. If the League doesn't p*** you off on this one, they surely will sooner or later on another issue, so better wait until then so you can say, "I'm infuriated; If the ARRL does/doesn't _______(fill in blanks)_____, then I'll NEVER join, for _____(fill in blanks)______." ANY ORGANIZATION wil eventually, royally, p*** you off!

Getting "infuriated" over FCC actions, League actions, election outcomes, or any one of a thousand other possible daily setbacks, can significantly shorten your life. That leaves less time for hamming, cabinetwork, bicycling, photography, or whatever else gives you pleasure (all of those apply to me). I'll continue to have fun after no-code, I'll continue to have fun reading QST and building the homebrew articles there, and I'll continue to use the QSL bureau because it saves me a lot of headaches. Cancelling my membership, refusing to join the next organization, or turning in my VEC certificate (which I don't have but one other recent protester claims he is doing) doesn't really hurt anyone but me. Really! I think we all need to stand up and express our opinions (by letter to those who make decisions) but this anger business is really destructive. And not for those whom we want to hate. It doesn't hurt them at all. It hurts us. I've been on the receiving end of protest resignations, cancellation of donations, etc. Have I lost sleep over those? I don't think so. Now if a full 15 percent of the amateur community cancelled/resigned/got off the air/etc. etc., then that would cetainly send a message. But its not going to happen. How many of us are really going to cut off our noses to spite our faces?

So RELAX a little, everybody. And I'll ragchew with you in another 5 years instead of reading about your BIG ONE in the obits.

73 & Happy New Year.

If the above posting doesn't take the cake for blind stupidity, I don't know what does. What a mature attitude! I didn't get my way some I'm going to take my ball and go home. Shesh, reminds me of some of the arguments my 8 year old has with his 10 year old sister. If this is your attitude maybe you weren't cut out to be a VE in the first place. I plan to welcome all new hams, no matter what class, to the hobby. I'm glad the VEs who tested me didn't have your attitude. They are VEs to bring more people into the hobby, not preserve unnecessary hazing rituals.

My previous response on NK8H's decision to turn in his VE accredidation
was directed to NK8H, not to person who forwarded to the newsgroup.
This type of response to the new code free Tech license could kill ham
radio.

What digital modes that are in the higher part of the band are
prohibited on HF in the CW subbands? None, I think.

Anyone else noticed the steady march of unattended HF packet robots
marching down into the "RTTY" subbands?

But Jim specifically referenced bulletins transmitted by W1AW, which
I receive regularly at my station.  ARRL Press Releases, which were
NOT in his reference, don't seem to come in here!   :)

Which ARRL handbook?

The new edition of the Weather Satellite Handbook by Taggart, published
by the ARRL has a bandpass/full wave detector. Figure 5.3 pg 5-5.

Another possiblity is a chip that SGS makes for Linear Variable
Differential Transformers that has a synchronous detector.
(The part number escapes me)

Actually, it was the Atlantic Division director. There is no such person
as a "Mid-Atlantic coordinator" in ARRL officialdom.

[deleted comments]

> now until Hell, for sure!

I realize that most of the net readers are aware of it, but it bears
repeating: Until the ARRL Board of Directors meets later this month
there *is* no ARRL policy. Only the Directors can set policy, and
they have not as yet done so. Comments from any individual Director
are, of course, very relevant since he/she casts one of the 15 votes.

The best way of influencing ARRL policy is, as always, to contact
your division Director. I urge you to do so.

Here's a good trivia question for you....

Who is the inventor of the Yagi antenna?

Based on your question, you probably would say Professor Yagi. Well,
you are incorrect!

The design of what came to be known as the Yagi antenna first appeared in
March, 1926 (and later November 1927) in the Journal of the I.E.E. of Japan.
This article was titled "Wireless Beam of Short Electric Waves", and was written
by S. Uda of the Tohoku Imperial University in Japan. The problem was the
journal (and article) was written in Japaneese, so it was not widely read
or circulated. In 1928, a colleague of Mr. Uda -- Mr. H. Yagi -- made presentations
of the design at IRE meetings in New York, Washington, and Hartford. Mr. Yagi
also published a paper in the June, 1928 Proceedings of the IRE. Since this
paper was in English, it was more widely read -- thus, the antenna became known
as the Yagi. It should be pointed out that Yagi did acknowledge the work of Mr. Uda.

Many books refer to the design more properly as the Yagi-Uda, to give credit
to the actual inventor.

(This information is from Constantine Balanis' Antenna Theory:Analysis and
Design).

> I am seriously considering purchasing a YEASU FT-757 GX II HF radio. It has the following features that I find attractive (this is not an all-inclusive list) - General Coverage receive (150KC to 30MC), CONTINUOUS DUTY 100 WATT TRANSMITTER, AM & FM included as standard, RF Preamplifer, CW notch filters, all-mode squelch, a computer interface, and external connections for RTTY, PACKET, and so on.
>
> Michael Ruhrdanz N0FER

Let's look at some of the features you mentioned:

FM included as standard: there is about a 1/2 second delay between a signal coming on, and the squelch opening up. You're always missing the beginning of the other guys transmission. If you ask a question with a yes or no answer, you typically hear nothing (he's said "yes" or "no" before the squelch opens). So FM operation is poor.

RF Preamplifier: the IF gain is so low, you need the preamp just to get anything resembling decent sensitivity above 15 MHz. I modified my 757 by adding 20 dB. of IF gain. After that mod, the RF preamp really could be considered to work as an RF preamp should.

Computer interface: practically every HF rig has that now. Also, it is known to be very RFI and ESD sensitive.

CW notch filter: yes, but the basic CW "500 Hz" filter is a joke with about 3:1 shape factor. I had to add a Fox-Tango filter to my 757 to get decent performance.

External connections for RTTY: so it has an AFSK input (big deal, saves you from having to use the mike input). The trouble is the rig doesn't switch fast enough for AMTOR, which is about all you hear these days. You can modify it, but you can only get the switching speed up to where it is within 5 or 10 msec. of meeting the spec, so even then, operation is marginal (can't work anyone less than 1000 miles away).

Continuous duty 100 watt transmitter: well really, you can transmit for 5 or 10 minutes at a time key down and then listen for a while, but the physics are such that there just isn't enough heat sink area to support 100 watts continuously, even with the fan running. Its not much of a fan.

Bottom line on the 757: It is one of the cheapest rigs on the market. It is also one of the poorest rigs on the market. You get what you pay for and no more. If that's all you can afford, it'll get you on the air. If you can afford a TS-440, etc., you will be glad you spent the extra money.

Ok folks, I just got off the air after a rather heated 1/2 hour discussion on 2 meters with the gentleman who runs the busiest VE sessions in North Jersey.

His position is that anyone taking the element 2 and 3a tests (Novice and Technician theory) now with the intention of getting a new Technician class license after 2/15 is wasting his/her time. Here's why. He says that there is no process in place to have people show up at a VE test session with the two CSCE forms and to generate a form 610 for a license. The current process requires one to pass some element at the exam session for a 610 to be generated.

I argued that this was not fair. That someone who has the requirements is entitled to the license and this needs to be fixed.

If there are any other VE's out there, peopel from a VEC, or especially the FCC that could help clear this up a reply would be most appreciated. I am sure everyone has their own opinion but it is most important that this be addressed by those in a position to actually process this information.

Does anyone have a phone number or email address I could use to get an answer directly from the FCC on this matter ????

I seem to recall discussion here before regarding phone rates for ham autopatches/repeater control. We recently had a problem where our phone line of the past six years was disconnected due to a mix-up when we changed mailing addresses. Now the phone company insists we have a business line for our repeater instead of the residential line we had for the past six years. When we griped, they said we were lucky they didn't charge us back fees for having the wrong service. To keep the fees down to the cheapest line available, we had to get measured service where we pay 8.2 cents per call and 17.50 line charge per month. We also have to pay $4.00 to NOT have a Yellow Pages listing! We also have a rotary line to save $4 per month.
Our service is through Michigan Bell, and Ameritech Company, so it's not one of those fly-by-night outfits.

Does any one have any sugestions or experiences in beating this? We would appreciate any help any one may be able to offer.

Please E-mail if possible, as I have a hard time finding time to read all the newsgroups.

Thank you and 73,

Try channel 60 on a cable convertor! That's 439.25 exactly!!! Rptr outputs on
421.25 is 3 channels down at 57!! A good antenna with a preamp and LOWLOSS
coax with work just fine!

In defense of Dr. Sagan, I should point out that in "Contact," the alien structure which detected the TV transmissions and beamed them back to us *was* described as planet-sized. Of course, the alien culture described in that novel was clearly thousands of years ahead of us, so maybe they just picked up the sub-space reflection of the TV signal, which is generated by double-reverse-phase gonkulation with the hyperspatial ether when the signal encounters the Van Allen belts, on their PanGalactic Space Walkmans. :-)

Seriously, though, I thought that the first few chapters of "Contact" gave a very accessible look at some of the problems and techniques used in current SETI efforts. Whether or not you like the rest of the book depends on how much you like SF, and Sagan's particular brand of it.

Lesson #1: The Nyquist Sampling Theorem

The Nyquist Theorem is easily the most important and fundamental concept in DSP. It is also one of the stranger, and probably least intuitive concepts in engineering mathematics. The idea that one can sample a signal, and retain all of the information in the original is suprising to say the least.

Let's start off by looking at another theorem that seems to make more sense, the Fourier Theorem. Simply stated, FT says that any signal may be expressed as an infinite sum of sines and cosines. Think of a signal as a vector in an n-dimensional space. FT allows you to break up that single vector into n-orthogonal vectors, which add up to the original. Thus, we can speak of a signal in terms of its original form (as a waveform varying with time) or broken down by frequency content (as a waveform varying with frequency).

Fourier analysis is a topic unto itself, as people have invented a number of ways to perform the mathematics quickly and easily. The classic text is Bracewell's "The Fourier Transform and Its Applications", a neat book to have just for the pictoral dictionary of transforms. In any event, there are a number of subtheorems to the FT, which allow one to generate and manipulate waveforms. For our purposes, we need the theorems that deal with impulses and periodic waveforms.

An impulse is simply a very narrow pulse. Mathematically it approaches zero width, but in practice it's simply very very narrow. The neat thing about an impulse is that, while it's narrow in a time sense, it's very broad in its frequency content. In fact, a true mathematical impulse has an infinite bandwidth; our real world equipment has limited bandwidth, which is why in practice our impulses are "very very narrow" and not zero width.

As it turns out, the frequency content of any periodic waveform (that is, one that repeats itself) consists of a set of impulses (or "impulse train") whose amplitudes vary; in fact, the variation is the same as if we were to run through one period of the waveform. Now, suppose that our signal is "band limited", that is, all of the frequency content lies between two discrete frequencies. Then we can represent our waveform (which is periodic and band limited) by a finite set of impulses, whose amplitudes are scaled by the frequency content of a single period. Those impulses are thus samples of the frequency content of a single period of the waveform. So, sampling in frequency corresponds to periodicity in time.

To review very briefly to this point, we've seen that a periodic, band limited signal can be represented by a finite number of samples of the frequency content.

Another neat property of FT is that both "domains" are duals. So, as it turns out, sampling in time corresponds to periodicity in frequency. Since most electrical waveforms that we have access to are time waveforms, this tends to be the result that's used more often. If our signal is band limited, then sampling in time results in a periodic repetition of the frequency content of the waveform. Since all of these repetitons are equivalent, it's wasteful to keep all of them around, so we'd like to be able to get rid of all but one copy -- and we want the original. The spacing of the copies depends on the rate that we sample the signal -- the faster we sample, the bigger the separation between the copies. Now of course, we'd like to determine the slowest sample rate, since the fewer samples we have to deal with, the better. As we slow the sample rate down, the copies of the frequency content begin to come together, as the separation decreases. Eventually, one reaches a point where the space between the copies becomes zero. The sampling rate at this point is called the Nyquist Rate, or Nyquist Frequency, and as it happens, the Nyquist Frequency is exactly twice the highest frequency sample in the signal. For example, the telephone system assumes that the highest frequency in human speech is 4.0kHz; the Nyquist Rate is 8kHz. Thus, the Nyquist Theorem gives us the minimum amount of work we need to do in order to preserve a signal.

If we sample below the Nyquist rate (either on purpose, or by underestimating the frequency content), the copies will overlap. This is known as Aliasing, and great care must be taken to avoid it, as quite obviously it distorts the frequency content of the signal. In practice, an Anti - Aliasing filter is applied to the signal before sampling, so we can be sure that the signal is band limited to an amount we'd planned on.

There are a few other considerations worth noting here. As it turns out, representing a signal by a finite number of time samples introduces a bit of ripple in the frequency content; the greater the number of samples, the smaller the ripple.

Another consideration is that most signals are not completely bandlimited. The trick is to study the signal, and determine what band contains most of the information (really, most of the signal power). This is usually done by using some sort of spectrum analyzer (either by using a self contained instrument, or by using software to perform the same tasks). A human voice, for example, really only needs about 2kHz for communication. The added bandwidth in the telephone system passes along certain voice characteristics that allow us to identify the speaker.

Next time, we'll look at how we can use discrete time samples to implement filters.

Not really. A DSP chip is nothing more than a special-purpose microprocessor. You COULD implement a word processor or database program on a DSP, although that would be a serious misapplication.

The hard part is learning the algorithms for doing filtering or other signal-processing functions. You can think of filtering as a form of averaging. For example, let's say you have a set of temperatures in Santa Rosa, CA for a year and want to generate a graph that is "smoothed". For each point (day), you could simply add in the data for the 3 days previous and the three days after and divide the result by 7 to get the 7-day running average.

What you have done is implement a Finite-Impulse-Response (FIR) digital filter. In other words, you have low-pass filtered the data. This is not the best smoothing function -- if you look at the response in the frequency domain, you will see that the frequency response has a bunch of spurious responses in the "stopband". A better "windowing function" would be to weight the 7 values, with values closest to the center counted the most. Each different shape of window has a different shape in the frequency domain (frequency response). The theoretical best window (rectangular "brick wall" frequency response) is a sin(x) / x function, but this requires an infinite number of samples (x goes from -infinity to +infinity), so real-world windows are always a compromise.

You can do a bandpass filter by using a window function shaped like a sine wave. (Polarity changes + to - every few samples).

FIR filters can always be implemented by simply summing in weighted samples of the input signal. IIR (Infinite Impulse Response) filters also sum in weighted samples of the OUTPUT signal. The advantage is that you can usually get away with fewer calculations. The disadvantage is they have an infinite impulse response and a delay that varies with frequency. They are also often harder to analyze and design.

There are software packages available to do all the filter design for you. I seem to recall I have seen software that runs on a PC for about the price of a good 2 meter HT. Perhaps someone on the net has more specific info.

>I had very good luck with a quarter wave (104") mobile whip mounted on the roof of my house (secured to a short mast), with three (four would have been better still) quarter wave (104") ground radials (#14 wire or thicker) sloping down at about 30 degrees below horizontal.

Right on the button. You can use almost any guage wire - I'm using 32+ radials of #25 enameled copper at 500 watts. Since 5 watts CB is pretty low current, the radials don't need much surface area. If you want to combine the groundplane with the guying system, you can also use aluminum guy wire, cut and insulated at the right length.

>Now, I was just imitating other working designs, without any really good understanding of antenna theory, so there are undoubtedly things I could have done better. Please do post, so we can all learn.

The sound of a scholar. Such humility is uncommon here. :)

Much of antenna design is mechanical, as well as electrical. Both parts of antenna design are well described in the ARRL Antenna Handbook. Great bedtime reading.

IMHO, one cannot do serious DSP without at least rudimentary knowledge of Convolutions, Z-transforms and Fourier Transforms. One does *not,* though, need heavier stuff such as Winograd FTs, Itakura iterations, Wiener-Levinson, LPC and such to thoroughly enjoy playing with discrete filtering.

And, you do *not* need to be a "computer nerd." In fact, I have seen few cases of being a "computer weenie" helping with the understanding of DSP fundamentals. Knowing applied mathematics is much more useful. I know, I know, we have fewer of those than computer nerds, even, in the Ham community.

That said, I think it would not take long for everyone to be able to play with DSP. How many people that you know who claims to "homebrew" antennas really know how to solve them integral equations? They use NEC (or one of the variants) and stop at that, at the most! Many claims "homebrew" just by cutting a piece of wire to 0.52 Lambda and feed it with a coax through a store-bought balun. But, they have fun, nevertheless. How many designing their own rigs bothers with the base-voltage-collector-current relationships?

I'll bet lots of kopeks that almost all the Hams playing with FIRs today are already using canned routines lifted from IEEE publications (probably the Burrus and Parks stuff :-) to help them design filters. But, hey, if it helps slowly for them to understand the need for odd-ordered FIRs, why not? I wonder how many of them worry about limit-cycles of IIRs. Don't worry, Jay, the "experts" of the use of DSPs in the Ham world aren't *that* many steps ahead of you.

Further, lots can be done with DSP without touching a single integral equation (just don't go try proving the convergence of certain series :-). Most of the work can be done with the summations that more people tend to have grips with.

At some point, I see DSP cookbooks much like, say, the Op-amp cookbooks of two decades ago. Before that, did many Hams use Op-amps? Although, the cookbooks will probably not be in the form of *schematics,* but be in terms of canned *design programs* running on home computers. And, just like people starting off with the op-amp cookbooks, the DSP newcomers will slowly and surely apply their own "tweaks," learning both from their successes and failures. You tend to blow up fewer parts with DSP. Just hit the Reset switch and only your ego goes up in smoke :-) :-).

The appeal of DSP to a segment of the community is the capability of creating filters that are tweaky, at best, to create using analog means. Just try comparing an FIR approximation of the Hilbert transform to one of the analog broadband quadrature phase-shifters that you can build. I hate to say this, you also have to "build" less :-). A good building block, once finished, can be reprogrammed to do something else when you are tired of it.

BTW, no one has mentioned this before, I don't think; at least on this newslist. With DSP, the Weaver method (sometimes called the "third method") of SSB generation becomes extremely practical. The 1800 cps (sorry, Hz; but the Weaver method did preceed the cps -> Hz changeover :-) whine should be perfectly nullable with DSP techniques. And, there is no broadband phase-shifters needed in the Weaver method (IMHO, Hilbert transforms are a pain even with DSP). Just an example of how DSP can make even old ideas work out better. A small QRP SSB rig based on DSP, anyone?

> Does anyone have any operating experience concerning this radio? I am

I considered this radio. I was also turned off by how the modes are switched. Also, the audio quality didn't seem very good. I think it has 10 memories which is o.k. but I have used most of the memories in my new ts-440 (it has 100). As a mobile radio, I think the icom radios (either the 735 or 725) would be better. I like the ts-440 better than the 735/725 or the yaesu 757, but then again it costs a few hundred more with the auto-tuner built in. I think it can be had for about $1k without the tuner, so thats about $100 more than the yaesu 757.

One problem with the 440: it takes up a little more space than the yaesu 757 or Icom 735 or 725. The 440 won't fit in my car very easily. The Icom or the yaesu might. If I had the opportunity to put a new radio in my vehicle it would probably be one of the Icoms.

Another thing to consider is the new Delta II from ten tec. This looks like a very fine radio and was supposed to be released in november. Does anyone know when/if it will be released? I hear it is supposed to cost about $1k.

True. But they are required to KNOW the policies most of the time.
A signed enlistment paper with E-6 isn't likely to turn into enlistment
as a pumpkin. And treatment as an E-6 or E-7 is a LOT better than
treatment as an E-1. Such enlistments look like highly preferred treatment
to me though careful scrutiny would be prudent.

Jim, your dislike of the military is contaminating your command of the facts.

In the last 15 (or more?) years,the services are required to honor a
recuriter's contract if it is in writing.
If they put in writing that you will receive 'A school' for electronics, you
have a committment. A spoken contract is worthless because recruiters'
tongues' are split at recruiter school and verbal committments are
unreviewable by "higher authority". (My ship CO had been a recruiter and
told us these facts.)

Yes, ham radio operators ARE a pool of trained operators. Fortunately,
most are too old to be tapped. The others are a pool of trained operators
available to be tapped as cooks if things don't work out:-)))

A friend of my Dad's 'placed out' of Morse class in flight training because
he was a ham. (Ancient history- 1955)

bill@platypus.uofs.edu (Bill Gunshannon) writes:

>And if your really concerned with TVI, have you tried watching Cable

>Channel 18 while running 2 meter packet lately?? Even my HT on low power can wipe it out. And I think there are more people watching Cable channel 18 than you are likely to find watching fringe channel 2 with rabbit ears.

This problem is especially acute in Urbana-Champaign. Cablevision chose to set their cable system up with offset channel numbers as such:

Station	Affiliation	FCC channel	NCTA channel	Cablevision channel
WCIA	CBS	3	4	3
WILL	PBS	12	13	12
WICD	NBC	15	16	15
WAND	ABC	17	18	17

So what we have here is the ABC affiliate being directly on the 2 meter band (NCTA channel 18, Cablevision channel 17). A 40 watt repeater using 4 dipoles at 300+ feet a mile away puts lines on my picture.

>Maybe this is another myth that should be put to rest once and for all.
>6 meters != TVI.

With cleaner transmitters around now, the problem is back to dirtier receivers and leaky cables.

> > I'll write and post, ok?

>Don't expect an answer. On my letter, the ARRL is the ONLY one who did not respond. Of course, those who agree with them may have better luck than I did.

I suspect the flood of letters and the lack of any position is causing them to defer any comment and/or reply at this time.

I did not renew my ARRL membership this year. But here is what I am now thinking of doing. I will take the latest offer the ARRL sent me to try to get me to renew (they offered me a free book to renew, each of which was either uninteresting to me or I already had) and write the following counter offer:

> I will renew my membership for one additional year in exchange for, in place of a free book in your offer, a set of teaching material and other aids for teaching a course for newcomers and Novices to get a Technician class license.

I will include my check for the currect membership rate, and address it directly to Larry Price. I will also add a further note:

> The ARRL stands to gain additional membership from the new codeless Technicians if it is perceived to be in support of them. Amateur radio itself will suffer if ANY band is dominated solely by new licensees. Placing them away from other amateurs is unwise, and will lead to a major rift in the service that cannot be recovered. Should the ARRL petition the FCC to restrict this new license class above 220 MHz, and if the FCC decides on the basis of this petition to make such changes, then this will be my last year as a member of the ARRL.
>
> The ARRL should consider, in weighing the decision on its policy in this matter, the proportion of opinion not only in its membership, but also in the new, and as yet unrepresented, potential membership the FCC decision in December opens up.
>
> One argument often made in favor of excluding codeless amateurs from the 2 meter band is that the band is currently overloaded in many areas of the country. I believe this to be absolutely false. What might be wrong with 2 meters is poor planning and poor coordination. Amateurs need to be more innovative in finding ways to increase the efficient use of all spectrum, not try to reserve enough room to just wallow in it.

I will then let him decide, on whatever basis he decides to, whether or not I will have at least one more year of renewal.

That certainly should be a major part of their action. But league policy
should not be decided entirely by member vote or letter pile heights alone.
The ARRL acted somewhat in a leadership role by establishing a committee
to study, and going ahead to propose, a codeless license class. I hope
in the end they take this as yet another opportunity to stay a leader.

Whats with this infantile hysteria? I've been reading this news group for years
and I have never read a posting from a CW OP that ever expressed an attitude
of snobby unfriendliness that you describe above. People who work a lot of CW
will be unabashedly enthusiastic about the mode but this has always translated
into a desire to share their pleasure with as many other Amateurs as possible.

Your paranoia is unfounded. If you talk to the many CW OP's on the air you will
find that far from looking down on you for any reason, they will be the ones
who will treat you with an attitude of friendly encouragement. You will find
them on all bands and all modes. Give them a break.

Further, they are not the enemy. Most CW OP's that I know support, as I do,the
new no-code Tech license. One reason the ARRL changed it's position on no-code
is that the membership changed it's position. These are the same members that
have been vilified as being OF's and opposed to change. If the long term
membership did not support no-code, the ARRL would not have backed it. We hope
for the best for the new no-code license. We hope at the same time that the
fundamental traditions of Amateur Radio will survive so that any new Amateurs

will inherit a hobby based on friendliness and openness.

I hope you are not as nasty on the air as you are in your posting. That does not bode well for the Service.

The codeless Tech test is a subset of the question pool for the Novice and Tech (FCC elements 2A and 2B). The question pool is published in quite a few books. There's even one at Radio Shack. The ARRL also publishes the pool. If you can find a local radio club, you can probably borrow one of these books for free. I'd lend you mine, but I borrowed it from a friend :)

Sorry Jim: I wish it were so but it's not. For many reasons (CCNR's, TVI etc.) I and many other operators are limited to CW for a good part of the day and night. If you eliminate CW as a viable mode of operation you will drive me and many others off the air. Is that what you really want? I am already being driven off of the CW portion of the ten meter band by the increasing illegal SSB and AM operation there. There is a reason for a no-phone segment of the band. Without it CW will dissapear. Is that what you want? Has Amateur Radio deteriorated to the point that some segments of the population don't care if other segments that may have spent a good part of their lives on the air are driven out of the hobby? Just as bad, may potential new Amateurs will not be able to operate out of the many new suburban areas with low power on SSB. Without CW they will have no alternative but to stay off the HF bands.
You say you want to attract new hi-tech hams to the hobby. Well here is one engineer that will be forced out of the hobby if the anti-CW histeria wins the day. Think about it.

>in all this is a tripler, then some of the un-tripled signal (at about
>143 MHz) could also be getting through.

Ignoring the possibility that someone has misprogrammed a modified dual-band rig you might consider an intermod product of the form:

```
    F3 = (3 * F1) + F2    where F1 = 145.41 (or .42)
                                F2 = 11.7 (or another similar IF)
                                F3 equals the product making you lose sleep...

yielding results close to (for instance):  447.03  ( 145.41, 10.8 ),
                                           447.06  ( 145.42, 10.8 ),
                                           447.96  ( 145.42, 11.7 )    etc...
```

Also the 150 to 160 Mhz band stuff could be a direct mix of 145.4x + some IF).

** End of Quote **
FCC rules allow Novices and Techs to be retransmitted onto 10mtr via croosband
rptrs BUT the rptrs MUST be within the 29.5-29.7Mhz range..rptrs on 10 are NOT
allowed to be operated outside this range....remote bases legally can ONLY be
controlled from 220.5 and above...which means Techs ona remote base CAN use
10m SSB from 220Mhz FM...a Novice cannot because they cannot be the control op
of a remote base...BUT a Novice or Tech on 220 can be crossbanded to
29/5-29.7FM!! BUT a 2mtr repeater CANNOT retransmit on 10mtrs below 29.5! ONLY
a remote base being controlled from 220.5 and above can do that!

** End of Quote **
Repeaters can be run in automatci control UNLESS they go into autopatch
mode...then a control op MUST monitor all communications and terminate the
patch if the rules are violated...Novices CAN use a 220Mhz rptr autopatch (I
know..I own two 220machines)...they cannot CONTROL a rptr though..use of the
patch is not contol provided another amateur is the control op..then the
Novice can enter the access code, dial, etc....just like everyone else...
Only when a rptr is in autopatch mode is a control op necessary (actually it
should be when any 3rd party is being passed thru the rptr but the FCC is
talking with the ARRL about this one I understood from several months ago...)
** Quoting Brandon S. Allbery KB8JRR to All **

>have one or more
>remote bases on it, following the same rules as above (Novices
>can't control
>the remote link but can use it, etc.).
** End of Quote **
A remote base is not defined in the rules as such..it ios called a "remotely
controlled station." and is subject to such rules...a remote base (for shorter
name) may be ONLY controlled by an auxillary station on 220.5 and above!
This makes a rmote base on a 2mtr rptr illegal...except a 2mtr rptr may have
"extra inputs and outputs" even in the same band PROVIDED they fall within the

RPTR subbands for the appropiate band (29.5-29.7;51-54, etc)..a 2mtr rptr
may have a 146.52 input/output in additon to its normal freqs (say for example
146.34/94 whew what an example!)..but the same rptr may NOT have an additonal
input/output on 145.6Mhz! this is out of the rptr subbands...
to summarize and simplify:
a rptr on 10,6,2 may croosband to any RPTR bband only (including its own)
but it must stay within the rptr subbands...(a 2mtr rptr with a 29.4 crossband
is NOT legal!)

an auxillary station or rptr above 220.5 MAY crosslink anywhere PROVIDED that
the control op has the appropiate license for the crossband or remote base
tx..(a TECH may operate a 10SSB rig between 28.3-28.5Mhz from 224FM but a
Novice cannot because of the prohibition against the Novice being a control op
of the aux link or a rptr....)
Confusing isnt it? not really...if you are a Novice, you can be crossbanded to
any RPTR band legally...as a Tech you may operate a remote base anywhere your
license lets you do so yourself (a remote base is you operating your HOME
station remotely..the same rules, etc applies no matter how you do it!)

I own exactly this combination and it works just great. The integral
automatic tuner can get the receiver down to 1.5 to 1 or better across
all bands. Of course it tunes narrowly in the lower bands, so changing
even a few KC means you have to re-tune. Also the antenna has to be
"right"; mine had some sections part electrical company (8 blocks from
the ocean means lots of salt air), and the AT wouldn't even try to tune
up under those conditions: went into emergency shutoff instead.

Of course you should still tune up the antenna as best you can, since
otherwise you'll end up heating coax when you could be transmitting,
even with a good match between the TS440 and the antenna feed. But with
a "window" on 80 and 40 that's only a few KC wide, the AT is invaluable
at making the rest of the band accessible. The tuning is so steep that
the AT is sometimes slightly fooled, and slides right past resonance too
fast, so it can take a bit of time to lock up on the low bands. But
on 20, 15 and 10 it does a fine job.

What are you talking about? I was into a nice QSO on 28.005 when I got blasted
by this BIG AM signal. At first I thought it was one of those @#*&^ CBers
pushing up the band. Then I listened a little more and it turned out to be two
guys from Tau Ceti speaking spanish. They were talking about the best way
to cook curried chicken (I checked with my wife and she said they were right
only she wouldn't use so much curry). I tried to break in on CW but they
ignored me. So don't say there isn't activity out there, they just dont know
the code.

Dunno about the HF6V, but our radio club has a TS-44S/AT. It has a spec'd
range of something like 25 ohms to 150 ohms (and I'm not sure if that's
magnitude or just resistive component...). Over that limited range it does
OK, though it does it slowly. I hadn't had any auto antenna tuner experience
since some Collins commercial gear, and it was disappointingly slow. I
hear the external one is faster but am not sure, as well as being wider
range.

Can anyone tell me the frequencies used by cable tv channels? I have heard it is possible to tune in ham radio (amateur) TV signals using a cable converter with an antenna attached, but I don't know what frequencies the cable channels correspond to. Specifically, the frequency I am looking for is 439.25MHz. What channel would this be on a cable converter?

While I am at it, does anyone reading this in the Southern Ontario region know whether any ATV activity is happening in the Toronto area? I have just bought a transmitter kit and hope to be on the air soon. I have some friends who are interested in starting an amateur tv "network". We are all "media artists" - video, computer, etc., and can see the potential of "personal television" for some really interesting projects. However, only two of us have our licences, and it would be nice to talk to someone with some experience...

And I did not say it did. And I wrote my open letter in the hopes of helping
them make the decision that they NOT choose to Petition for Reconsideration.
Is that not what _I_ should have done?

Precious little good it will do them. The FCC has obviously decided that the
Antiquarian Rant 'n' Rave League is not leading ham radio in the direction it
should go.

I do not disagree (and will do the same), but isn't it sad that to accomplish what's right, we have to appeal to their greed?

And they say it's not just a publishing company...

>>>   It just seems like that would generate a lot of energy at the antenna

>>> of the scanner-- how much is too much?
>
>>This should not be a problem. A 100 watt transmitter working into a 50 ohm load will generate about 70 volts of RF. Field strength falls off to the inverse square of the distance. At 100 feet the RF voltage across 50 ohms should be 1/10,000 of the voltage at one foot. So the scanner should see no more than approximately 7 millivolts at it's input. A one kilowatt transmitter in the same circumstances would produce about 22 millivolts at the scanner. That shouldn't cause any problems. This has been a simplified calculation ignoring near field effects, but should be ballpark for this situation. At 80 meters the numbers would be somewhat different as near field effects would predominate and you could see volts of signal at the scanner.
>
>>Gary KE4ZV
>
>
>The RF voltage field from a radio transmitter falls off as the INVERSE of the distance, not the INVERSE SQUARE. One Kilowatt ERP generates a field of 186 millivolts per meter at one mile, in the absence of attenuation. At 100 feet, the RF field would be 186*5280/100 or 9.82 volts per meter.
>
>Ya'akov VE7-ALQ

Well yes, the RF voltage field does fall off to the inverse of distance. But I am quoting voltage across 50 ohms in the above article not volts per meter. That is another way of saying power, and power does fall off to the inverse square of distance. I guess that wasn't as clear as it could have been. The defining equation is:

Pr/Pt=Ar*At/d^2*L^2

Where Pr is received power
Pt is transmitted power
Ar is the effective area of the receive antenna
At is the effective area of the transmit antenna
d is distance
L is wavelength

As you can see, received power declines with the square of the distance and the square of the wavelength. This formula is valid where the inequality d>>2d^2/L is satisfied. In this case where the two antennas are separated by greater than 20 meters.

What we are interested in here is the voltage across the input impedance of the scanner, 50 ohms, as that is the voltage capable of doing damage to the scanner. And we can see that the voltage is quite low.

>Such as a direct beam of light :-)

Uh, no, not if by that you mean noncoherent light in the range visible to humans (approx 700-400nm wavelength). The universe is filled with lots of extremely powerful natural generators producing these signals - they're called "stars".

If you read up on the background of SETI, the first thing you find is that choice of frequency band is critical. The infrared and optical wavelengths are dominated by thermal radiation from stars and similar objects, while the longer radio wavelengths are wiped out by natural non-thermal RF sources (synchrotron radiation, etc). This leaves a window in the range from 1-10GHz that seems optimum for interstellar communication. (There are lots of other factors such as quantum limits, atmospheric absorption, receiver technology limits, etc, but these are the fundamental ones.)

Those interested in reading up on SETI should check the back issues of the Planetary Report, the newsletter of the Planetary Society. There is also an excellent NASA report SP-419 "The Search for Extraterrestrial Intelligence" that Dover published in paperback form (ISBN 0-486-23890-3, $3.00). It was published in 1977 so it's slightly dated with respect to the signal processing technology. But the majority of the report deals with the fundamental principles of SETI, so it's still very much worth reading.

To anyone who is building tube-type amplifiers and is wondering about fusing
or otherwise protecting the tubes against over current (either plate current
or screen-grid current) here is a useful (and cheap!) tip.
Firstly, do not use a fuse! The current needed to take out a fuse is several
times its marked rating; so a 500mA fuse will actually pass many amps for a
millisecond or two before it blows. In this time, you can easily weld together

the internal structure of the tube. Remember that the smoothing capacitors of the power supply represent a significant energy store.
The answer is a combination of current limiting and electronic protection; put a low value (100 ohms or so) resistor in the B+ feed to the plate or screen-grid feed; this will limit the current that flows under flashover or short-circuit conditions. Also, fit a low-value resistor to the B+ feed, calculate this resistor so that under peak drive conditions it is dropping about 1 volt.
Then connect across this resistor, one of the cheaply-available opto-isolator ICs; these consist of a LED and a photo-transistor (or photo-SCR) and are usually rated to give 3 or 4 Kv isolation between the two sides. Now you have a circuit which, if excessive current flows to the tube, fires the LED in the optoisolator, and turns on the phototransistor or SCR. The panic-circuit that cuts the power to the tube can all be at low voltage since the optoisolator is keeping the B+ voltage away from it.

(I have seen a similar circuit, driving a latch & counters, used to count tube flashovers in a commercial RF power-generator (flashovers often happen if the unit is run with too small a load or no load at all) - the maintenance technicians were changing the tubes after a certain number of flashovers had been registered. One of the users (a ham) discovered how to simulate flashovers.... he then asked the maintenance team what they did with all the tubes they pulled, bought the maintenance guy a beer or two, and started building a K2RIW-type linear knowing he had a good supply of tubes!)

Note that since some of these optoisolators will work with very small currents (a few milliamps) you can also use them with class 'C' tube amps that get their grid bias from drive rectification, so that if you lose the drive, the tube B+ and screen-grid feeds are opened.

Actually, if you take all of the tests to get an Advanced license in
one sitting, you are responsible for knowing subbands for Novice, Tech
and General as well, even though you will never be confined by them if
you pass the test. That is a side effect of the modular examinations.
The alternative is to have a complete exam for each license class and
no credit for past examinations.

The point is well-taken, I have thought of it myself as seeming a little
funny.

[previously-posted accounts of ham radio in the funnies deleted.]

In the 1950's, some bad guys kidnapped Dick Tracy and used a helicopter to maroon him in Mexico in an enormous pit completely surrounded by overhanging cliffs. He waited for favorable propagation conditions and used his wrist radio to contact a ham, and thus was rescued. Since DT's wrist radio is nuclear powered, battery life wasn't a problem.

Such a place actually exists; it's called "El Sotano" and is 1300 feet deep. American cavers found and descended it ca. 1970. It's so large that it looks like a valley instead of a pit, and sometimes people rappel through a cloud layer on the way to the bottom.

-converter with an antenna attached, but I don't know what frequencies the
-cable channels correspond to. Specifically, the frequency I am looking
-for is 439.25MHz. What channel would this be on a cable converter?

421.25 = 57
427.25 = 58
433.25 = 59*
439.25 = 60

*Not in the bandplan for ATV.

The antenna was actually invented by his student Uda, who didn't
know English. Hence, Yagi wrote the paper on it and got the
credit for it. In recent years, academics have started calling it
the Yagi-Uda array to redress this injustice. I'd suggest you
write to Yagi's university to see if any archives survived the
B-29's. If you can find his original paper in the 1920's, it should
give the name of the university.

Does anyone know of an LED flasher that is more efficient than an LM3909.
I am NOT looking for a 555 timer circuit.  Thanks.

Not really.  It would seem to me that a major point of the exams
should be where one can and cannot transmit, and what type of signals
are allowed in which subbands.  After all, it is CRITICAL for any
operators to know the rules and be able to avoid poor operation,
anything else is window-dressing.

Steve! I thought you understood how it's supposed to work. Whenever the League does something that is the will of the majority but with which you disagree, the League is guilty of lack of leadership. But if they do something that is _not_ the will of the majority and with which you disagree, then the League is guilty of being antidemocratic and fascist.

I thought you knew that! :-)

As a point of interest, one of the fellows who hold the patent for
this antenna is a ham, W2EBS. His name is Bob Lewis, of the
classic 1930's paper on radial ground planes (Brown, Lewis, and Epstein).
He is 83 and still continues his interest in antennas. He is
currently one of the review board of Communications Quarterly.

BTW, the proper configuration is an upright quarter wave element
and quarter wave length radials. Since in this case the radials
are tuned, they must be exactly quarter wave length.

I have an opportunity to buy one of these antennas at a very good price.
Anyone had any experiences (good or bad) with one? How well do they work?
My particular concern is mechanical robustness; previous Hustler antennas
i have seen seem to be well constructed, but have never seen a CG-144
in close-up..

Does anyone know of a source for a touch tone pad for a Kenwood
TR-7400A?

Or, how about a source for a mic which has a touch tone pad and can
be modified for use (if necessary) with a TR-7400A?

Used is just as fine, if not finer, than new.

Thanks,

I am seriously considering purchasing a YEASU FT-757 GX II HF
radio. It has the following features that I find attractive (this is
not an all-inclusive list) - General Coverage receive (150KC to 30MC),
CONTINUOUS DUTY 100 WATT TRANSMITTER, AM & FM included as standard,
RF Preamplifer, CW notch filters, all-mode squelch, a computer
interface, and external connections for RTTY, PACKET, and so on.

Does anyone have any operating experience concerning this radio? I am
interested in any comments you might have. If you know of another
radio that has these same basic features in the same price range ($900),
feel free to discuss that one as well.

Thanks
Michael Ruhrdanz N0FER

Well here it is folks. Mr. CW admits that CW won't hack it in the face of a little adjacent channel operation by another mode. I guess he never tries to work 40 meter CW at night either. All those megawatt SW broadcast signals must make CW operation disappear from the band. :-)

Hey Dick, even poor old dyslexic Morse confused me has worked 40 meter CW. If you can hack that, you can handle *any* interference from puny ham transmitters. Besides, you can catch up on the *straight* news from Radio Moscow between beeps. :-)

While the Generals have been busy blasting away at 14.313, the Techs have been building antennas for OSCAR, amps for 1.2 GHz, linked microwave systems at 10 GHz and playing with the packet and DSP techniques...done any of that stuff??!!

Now that sounds like fun stuff. How about some more information on the projects above.

>
> is kicked back to 5 WPM. There's really no reason whatsoever for anything faster in terms of the ITU regs, or the skill level of the operator.
>
> If you could explain ONE real reason why that 13 WPM/Element 1b makes a ham any better, I'd love to hear it!

Ok. Passing the 13WPM test means you probably can use CW at 5WPM in the real world.

> To my way of thinking, it's just another stumbling block - another way of keeping the inner-sanctum of HF from people that would be interested in it bringing technical growth to it! (no :-)'s here...I'm very serious about this.)

Maybe. But the names in the news of the folks making the big steps today have lots of those funny 2x1 calls. It doesn't seem to be that big of an hindrance.

A local engineer just received his ticket. He's a hotshot EE who'll be a great addition to the ham ranks. He went from no license to Extra in one test session. He didn't find the code an stumbling block - he thought it was fun. A challenge. Took him 6 whole weeks to pass the 20WPM test.

Often it seems that the learning the code is influenced far more by

```
attitude than by ability.

I think new decaffinated/decoded Tech license was a great move by the FCC.
I also don't find any problems with the HF licensing system.

Now if only we can get the SSB off 20 mtrs - it'd be a great digital-only band.

Simple, stupid box as I recall. Just like the one they used in the
movie GRAY LADY DOWN.   High frequency sonar transmitter(60Khz??)
Injected tone CW or DSB no carrier (I think) voice. No
scrambler. Used for talking to surface ships and other submarines in
the area while submerged.
```

Non-secure, normally danger tagged while on patrol because of emission
control hazard (transmit on it and the bad guys will hear you).

Typically we would use it to talk to surface ships escorting us on sea trials
or when conducting rendezvous for "games"

One had to speak slowly and distinctly, as if thru a bullhorn, to make
oneself understood if there was a lot of reverberation off the bottom
or the water surface (smooth bottom and glassy sea was the pits!).
Range depended on environmental noise and reverberations.
Ham radio experience was useful for eliminating mic fright and for copying
the other guy's tranmsissions thru his self-generated QRM.

Just your basic, simple, underwater sonar telephone :-)

Well, it was better than banging on pipes.......

Sorry again Jim, I didn't mean to jump on you but the situation on the low end of ten is really getting bad and it is moving up into the beacon area and even into the novice phone portion of the band. I hate to see the only phone band available to Novice and Tech OP's ruined by illegal operation. I try to spend a certain amount of my operating time just rag chewing on the novice bands both phone and CW and have made many new friends there. When the cycle dips the mess will go away on ten and will return again with the new rise. We'll see...

I don't see anything odd about the current examinations. When you stop to think about the license structure as a progressive series, with each step being more complex than pervious ones, then the current method makes sense. The whole system was, IMHO, set up for people to progress from one class to the next higher class. Thus the exams were structured so that you didn't have to take the entire series every time you wanted to upgrade.

(change "pervious" to "previous", all you editors :))

I really can't see why anyone would object to having to know the simple basics of the hobby, anyway.

Geez! The exams, and the testing method, are so simple! What's to whine about?

Actually, this situation *has* existed before; back before the Techs were granted Novice HF priveleges. I believe that the answer then was yes, a Tech could use such a machine, as the Tech was transmitting only in a band for which he or she was licensed, and so was the repeater (the "privileges" of the repeater being derived from those of its licensee (and/or control op?)). This is just like you as a Tech talking to someone via my station with me (an Advanced) at the controls; your license class doesn't matter, it's mine as station licensee and operator which determines whether we're legal or not. (Or else non-hams would never be allowed at the mike!)

Or am I completely wrong about all this?

>   - Have the impedance matched at 50 Ohms.

In the situation you describe, you want the coupling capacitor to be a low impedance (relative to the load) at the frequency in question, namely 10.7 MHz. "Matching" the cap to the cable is not a concern; rather, you want to match both the total output impedance of the R7000's IF stage (if only you knew it) and the NRD's input (known to be 50 ohms) to the cable. Since you don't know the R7000's IF output impedance, we won't worry about it for the moment; it won't really matter that much anyway, since with a 50 ohm cable feeding a 50 ohm load, there will be no reflections from the load end anyway. (And these aren't really that big a concern in the first place; you're really only concerned about matching to the source - the IF output - to get the best power transfer. But more on that later.)

With that said, let's just choose a cap which will meet the requirement of low impedance at 10.7 MHz. For the cap to be 1 ohm or less at this frequency, it should be greater than about 150 nF (0.15 uF). You also want a cap of this value that can still be expected to be a cap at this frequency; in other words, it should have a self-resonant frequency well above 10.7 MHz. Find a good ceramic or mica 0.2 uF cap, and mount it at the R7000's IF output, keeping the leads as short as possible. Connect the coax to the other side of this cap, and the closest ground available.

>1- What is the formula that gives the resonant frequency of a capacitor?
>The formula giving the resonant frequency of a circuit,
>f=1/(2*PI*SQR(L*C)) lets me wonder what value I should take for L
>Should it be the impedance of the coax (50 Ohms).
>The ARRL Handbook has a table of resonant frequencies for capacitors
>and specifies the length of the leads, but that table does not have

As mentioned above, you do not want the cap to have a reactance of 50 ohms; it should be much lower. There is no "resonant frequency" for a cap by itself, unless you count the lead inductance (as the ARRL tables show). This gives the self-resonant frequency, which is not of interest here except that we want the self-resonant point to be much higher than 10.7 MHz. (Above the self-resonant point, caps act like inductors; the capacitive reactance has become small compared to the inductive reactance of the leads, which then *increases* with higher frequency.)

One possible problem, though, is that you may be coupling *too much* signal from the IF output to the antenna input; there's typically much higher signal levels in the IF than an antenna input would expect. This can actually degrade the performance of the receiver, as the front end would overload. If you can, you may wish to connect the signal into the second receiver later in the front end, or add some attenuation prior to coupling the signal to the antenna input.

The ARRL _Radio_Amateur's_Handbook_ is a very good source for further information on these topics. I'd suggest looking for it in your local library.

>peice of sheetmetal for a ground plane. How big should I make the sheet
>metal?

At a minimum, 1/4 wavelength radius, centered on the antenna. (At CB frequencies, that's about 109", or a bit over nine feet.) But you don't need a solid sheet; several "radials", or grounded wires of about this length stretched radially from the grounded mount at the base of the antenna, will work just as well and be a whole lot simpler. You've probably seen the CB "ground plane" antennas, with a 1/4 wavelength vertical whip surrounded by 3 or 4 drooping horizontal elements of about the same length - those sorta-horizontal elements are the ground radials.

For a home installation, you'd be much better off making a full-length 1/4-wave whip than using a loaded mobile antenna (the kind with a coil in the middle or at the base), and at least 3 or 4 ground radials (the more the merrier; keep 'em symmetrically spaced about the vertical element, i.e., if you have four, they should be 90 degrees apart.   "Drooping" the radials slightly - as you see on the commercially-made base antennas - raises the feedpoint impedance slightly for a better match to 50-ohm line (a vertical whip with a "perfect, flat" ground plane has a feedpoint impedance of about 37 ohms).

Another option would be a half-wave dipole (about eighteen feet overall at the CB frequencies) mounted vertically; this'll only work, though, if you can keep the bottom end as well as the top well off the ground and away from any conductive structures such as towers.

(Obligatory plug for ham radio - have you heard about the new no-code

Technician license? Now may be a good time to consider "stepping up" from
CB!)

I have had the radio that you are looking into for almost a year. Basically I like the radio but I do have a few complaints.

First of all, I use it alot for mobile and the green LED display is worth crap in a bright sunshine, which is most of the time that I am on the road.

The thing that I dislike the most is the way you have to switch modes between CW/AM/LSB/USB/FM etc. It uses to buttons to progressively choose from one to the next. When I drive, it is a pain to have to press the right button (which is not lit at night) 5 times to go from FM to USB. I do this a lot on 10 meters.

Measureing SWR is even a bigger pain. The control is way in the back and is very difficult to get to, especially in the car.

I also had a chance to compare how the VFO on an ICOM works compared to the Yaesu. The Icom is velocity sensitive. In other words, the faster you turn the VFO know, the frequency change is accelerated. Very convenient to get from one band edge to another. I sorely miss this in the Yaesu.

Finally, I think that the way memories are programmed is a bit schlocky. I don't know how the other radios work but my ICOM HT is much easier to use.

Don't get me wrong, I do like the radio and it does perform very well. But next time I will probably go with an ICOM. I think that it's worth the few extra bucks.

Good Luck,
Tom

> a solid unit, but I haven't had any personal experience with it.
>

I believe this is inadequate if you wish to use omni's. If you want to save $100 over the cost of the PacComm PSK-1 and you wish good BER performance out of omni antennas, get the TAPR kit. TAPR is in Tuscon and I have forgotten the address and phone number.   I probably should keep a copy of that here on my email machine at work, but I always manage to forget. If you are using omni's and have not compared results with a correctly tuned PSK modem from TAPR and/or PacComm (the paccomm is a licensed variant of the TAPR box), then I suggest you do so. The problem with the G3RUH is that it assumes a good SNR at all times. It is an all digital design and hard limits the signal as it comes into the box and then does a squaring loop demodulator. While the latter is theoretically equivalent to a Costas loop demod (as in the TAPR/PacComm), in practice it is almost never equivalent. Good lowpass filters are just inherently easier to do than bandpass of the same Q. Hard limiting is theoretically only 2.2 dB or so worse than not hard limiting. This is in the presence of white Gaussian noise. The noise out of most SSB radios is neither Gaussian or white. All taken together this leads to a 10 dB worse implementation loss of the G3RUH design over the TAPR. If you have not yet purchased a modem, and you do not yet have gain antennas, I strongly suggest that you consider another possibility and not use the G3RUH. If you have gain antennas already, there is so much link margin from these very loud satellites that the G3RUH is at no disadvantage except during the deepest fades and I would decide only on the basis of which is cheaper. On Gary's other comments concerning converters we are in complete agreement. Jan King and I have begun using discone with amazing results and I should be reporting on that soon enough.

Truth in advertising requires me to tell you that I get a royalty as one of the designers of the PacComm PSK-1. I am not sure but I believe the price of the kit from TAPR and the price of the kit from Radiokit are comparable. On that basis, if I were going to do a kit, I would do the one with the best performance but this is from vague memory. I would check the current prices.

Gary and I are not talking about the G3RUH 9600 bps modem design which is currently the best commericially available modem for 9600 and is available from Kantronics and PacComm. I believe it is called the NB-96. James has done a beautiful job on this. It is the only commercially available full duplex 9600 bps direct FSK ham modem.

(Is that enough adjectives or what?)

> The main thing you may need is a "mode J" filter to keep the 2 meter
> signal and it's harmonics out of the converter. Spectrum International
>
> Gary KE4ZV

I couldn't agree more. They are simple to construct and easy to tune. One is especially desirable if you wish to try omni's. Do not expect to have good luck with the omni's for at least a month. We just released the BBS on the microsats and they are extremely oversubscribed. Gary and I contend for the uplink at least twice a day! An omni station will work with the microsats after the AO-13 boys and girls quit using 1 Kw eirp (or more). I strongly believe that it takes more work to make an omni station work but considerably less money. You simply must do everything right. No desense from the 2 meter transmitter can be tolerated. A good preamp, that doesn't collapse from proximity to the 2 meter transmitter is required. Your deviation must be about 3 Khz. It is amazing to me out much better the throughput is into the Microsats with 3 Khz deviation than you get from 5 Khz. The filters are a little tight for the beginning and ending of the orbit if you are not tuning your uplink to compensate for doppler. The phase group delay at the edges is worse than we desired. Get away

from the edges and the filters are beautiful. The receivers in the Microsats are especially sensitive to overdeviation. If you are digipeating through the satellites, you can sometimes see two packets from you when you only sent one. If this occurs very often, you are overdeviating. I run my `mike gain' or modem output level at a setting so that when monitoring my signal on another receiver, it sounds a little weak in audio. You will not be weak at the satellite if you do this. Remember this is a carrier, and you are modulating the frequency with Manchestered NRZI data. In a correctly designed FM tranmitter, there is little or not AM modulation. Since I regularly load code to the spacecraft, I have a monster uplink, which I cut back to 8 watts to my gain antenna when I am not loading code. This works out to be about 100 W eirp. Even this is too much.
After I cut back the deviation, I have yet to see one of my packets doubled or the spacecraft respond that it heard me on the wrong channel. (It does this inside the response to bootloader commands).

Attention please!

I still have trouble getting stuff in past the folks who refuse to look and listen to see if the bird is operating or being loaded.

>ROM replacement. I wouldn't bother with the multimode wonder boxes. The
>compromises inherent in a do everything box mean that they do nothing
>particularly well. Also, the external modems we are talking about are
>specifically designed to interface with the TNC2 and tying them to one

Most TNC's running later versions of the ROM have KISS built into them. All one needs do is to say KISS ON. In some tnc's, this must be followed by a restart. To get out of kiss mode, a special command string must be sent to the TNC (KISS command 255) which will return the box to regular operation.

As for `do all boxes' being comprimises, with the PK-232 you are correct, as well as MFJ 1278 and KAM. Let's consider the PK-232 since you mentioned. it. The use of 200 Hz shift on baudot is an example and the noise performance of the Baudot demod suffers from the use of the BEL-103 receiver filters in a filter / slicer discriminator. Hooking up the external modems to this is a real pain as well. However, with the new DSP style `do all boxes' I can assure this is an incorrect statement. The baudot modem I just finished for the DSP-2232/1232 outperforms any I have tried and the PSK modem for PACSAT is second to none. The AO-13 demod copies reliably through spin mod fades and I use it daily to talk AMTOR and to UO-14 using the G3RUH 9600 bps modem. All are within 0.1 dB of theoretical performance. The day of the do all boxes being comprimises are almost over. There are things these units cannot, and will not do. 56 Kbps is completely out of their range at this time. The analog front ends, made up of programmable filters, are incapable of being tuned up to running with a 100 Khz bandwidth signal. Indeed, the A/D's will not run faster than 100 Khz. TAPR/AMSAT has finished its design and I have a Beta board to port the modems I have done for the TMS320C10 board we began all this with to that board. Lyle wants this out the door now. So do I, if for no other reason than to stop people from wasting their money because of fancy ads for vaporware. If you want a cheaper alternative to the AEA box, and will settle for slightly less capable hardware and/or you want it to plug it into your PC, wait a little while for the TAPR/AMSAT board. If you want the do all multimode then the AEA is the current best bet. Don't ask me for shipping dates. Call AEA and TAPR.

Gary's advice in all other respects is good and he is a very active user of the birds (I get to see the log files ;-).

Dave:

I have in use daily the AEA DSP-2232 running a UO-14 modem.

A UO-14 modem is 9600 bps direct FSK. What that really means is that you put shaped data on the modulator of in a true FM radio. You take the data for receive directly from the discriminator in your FM receiver.

Since you do not wish to have much in the way of a DC bias in the bits to be received or transmitted, the data is sent through a circuit called a scrambler. This is not in use as an encryption device, since their is no cryptovariable, and since it is self synchronizing.

There are several ways to go. The cheapest is to buy one of the many variants of the G3RUH 9600 bps FSK modem. It is the best commercial modem available to do this job. Both Kantronics and PacComm have variants of it. The other is to wait for the DSP boxes to be released as they will do this and more. I have a G3RUH (which I loaned to someone else) and have not had a chance to use it on the satellite. Others that are on the satellite are almost exclusively using the G3RUH.

The uplink for UO-14 is 145.970 and the downlink is 435.075, please compensate for doppler. You should be able to copy this extremely loud signal with omni and your FM receiver (if it can tune 435.075). You will see the S meter rise and the noise get quieter. What I mean by this is that 9600 scrambled data sounds like `quiet FM noise' is the best way I can describe it.

Did I help?

Bob

Just when you think it is safe to go back in the water...
Just when you think the Crossed Field Aerial has gone the path of Cold Nuclear Fusion...

Hately (GM3HAT) and gang has another article on the CFA in the

December issue of Wireless World! (Hey, Paul Nix, Ron Todd, and others, are you reading this? :-) :-)

For those who have not been following the CFA since April 1989, the CFA is based on separately generating the E and the H fields using different antenna elements and assume that E x H to form the Poynting vector just "happens" through mathematics. (All classical notion of an antenna have the same piece of metal, e.g., a 1/2 wave dipole, generating both the E and H fields.)

Those who passed their tests by memorizing the FCC question pool can hit "n" now. You can't really buy a working CFA from HRO yet. :-) :-)

The Hately gang has apparently gone to a monopole-like configuration of the CFA. Imagine the original symmetrical CFA. Chop it into two equal halves, throw away one half and place the remaining half over a ground plane.

Now get this: the ground plane is only 1 metre square at HF (I nearly fell off of my chair :-).

Their reason for preferring this configuration is because they claim that ground reflections would cancel out signals from the opposite set of elements.

Another thing mentioned is how critical the phasing between the E-cylinder and the D-plate are. So, I gather that the antenna itself may be broadband, but the phasing unit is not. Nevertheless, they showed a Smith chart plot of the impedance at the transmitting end of the phasing unit that looks like it would translate to a VSWR of less than 1.2:1 across the entire 15m phone band. Not bad. I can live with that. They also mentioned that you can get 1.5:1 across the entire 80m band.

There are sketches and photos of the new CFAs, but no diagram of the phasing unit. The phasing unit is described, though, as a power splitter that feeds equal power to the E-cylinder and D-plate with an advance of 45 degrees in one case and retarding 45 degrees in the other. They seem to claim that you only need to get to 45 degrees to within a degree or two.

The authors also made some claims about the size of the "inteaction zone" where the Poynting vector synthesis takes place. They also modeled a 1/2 wave dipole the same way to show where it's "interaction zone" is (i.e., where the E and H of the dipole are "properly" phased) and claim that that is where the 1/2 wave dipole really puts out it's "stuff." From this, they claim that since the CFA provides a small source wavefront, that very small reflectors (1.5m dish at 21 MHz) can provide both gain and front-to-back, and believe that the old paradigm of requiring reflectors to be the size of a waveLENGTH be changed to requiring it be the size of a waveFRONT, instead.

Now, the claim is (otherwise it would violate the reciprocity theorem, now, wouldn't it? and they would have to invent new Physics; not that they have not already!) that the thing works just as well as a receiving antenna. What I don't get is: how the heck can you get more that a 6 dB improvement over each of the two chunks of metal (one is a disc 40 cm in diameter; the other is a cylinder 20 cm in diameter and 25 cm tall) by themselves. Each of those chunks hardly constitutes an element with a decent aperture area. An extreme case of the "supergain" condition for antenna arrays?

Well, break-through or snake-oil? You decide by reading the article yourself. Wireless World is *always* worth reading, in any case. Just don't flame (shoot) *this* messenger! Anyway, watch for fireworks in the Letter to the Editor in subsequent issues of Wireless World.

Many thanks to those that posted or E-mailed instructions for PRO-2006 modifications (particularly Manwai and Paul). I have made the necessary modifications and everything works "as advertised"!

In case there are other PRO-2006 owners who might also be looking for the cellular restoration (and a scan/search speedup) modification, I've enclosed the instructions which I received via E-mail. These modifications are VERY simple and quick.

> Hello,

> I too just purchased a PRO-2006. That same day, I made the mods....
> It took all of 5 minutes....

> Remove the top 2 phillips screws in the back of the unit.
> Slide off the top cover.

> Locate two diodes... directly behind the "3" key on the keypad.

> The diodes are D502 and D503 (you'll notice an empty spot between them...
> which doesn't really make any sense since there is no gap in numbers
> between D502 and D503 ... but anyway...)

> Clipping D502 restores the cellular band.
> Clipping D503 increases scan speed by 16% to 15 and 30 channels per second.

> Could you possibly mean *paid*?
```

One of the dictionaries I have lists "payed" as an obsolete spelling for "paid". Obsolete, as in old, not wrong.

Are you telling me that you have so much trouble with anything that is not spelled exactly as you want to see it that you actually had trouble understanding what I wrote? Is it not completely clear from the context of the sentence what I meant (ignoring the fact that "payed" is a valid spelling)?

> I also correct the spelling and grammar in my boss's memos and repost
> them. He loves me. :-)

Your boss's secretary should be doing this for corporate memos. Corporate memos are the formal written communication of the company. If you are altering memos over your boss's signature you are forging corporate communications. It is lucky your boss loves you -- if he didn't he would fire you. I would.

> Seriously, it only takes a moment to run your article through the
> spell checker before exposing it to the world.

Seriously, you have no idea how long it takes to do something here. Why are you are qualified to tell me how hard or easy it is to do something? Do you actually think every place in the world is just like where you are, and has the same utilities that talk to each other in the same way?

Please enlighten me on "THE spell checker". Did you mean "A spell checker", or do you not know there are many different ones? Oops, sorry, you have only one, so there must BE only one.

> If your writing habits are untidy, muddled, and indicative of a poor
> education, then your ideas are also suspect. This may not be fair, but
> it is the way it is.

Gee, just a second ago, you say how easy it is to spell check everything. It seems that good spelling is more a case of owning a spell checker than of a good education. Do you really mean you judge people's ideas by whether they have a spell checker or not? Sounds like a pretty stupid criterion to me.

This whole chain is stupid. It is stupid to waste the net bandwidth on nit picking spelling and grammer flames, unless there is a real problem in understanding the message. In all the time I have been reading the net, I have seen only ONE message that was in such unusual English that I could not decipher it. And even then, it does not deserve a flame.

Flaming someone about one misspelled word is just an attempt to prove to the net how smart you are and how stupid the misspeller is. It does not belong on an international network, and it certainly should not depend on how "ethnic" someone's name is. If you want to correct someone, do it by mail. You lose the "everyone look how smart I am" feature of the public flame, but you save the bandwidth.

If you want to continue to judge people by their ownership of a spell checker, or their name, I cannot stop you. Just don't demonstrate your mental superiority by flaming spelling errors. Now, let's stop all this worrying about how things are spelled or slips in grammer and get back to ham radio things.

KING RICHARD: "Come, bustle, bustle; caparison my horse;
Call up Lord Stanley, bid him bring his power."
Richard III, William Shakespeare ACT5 SC3

<And, no, caparison is spelled correctly. Look it up, you'll remember it longer.>

I had the occasion once in connection with a radio club public service event to ask the FCC about the use of tactical callsigns. The answer was, "As long as you ID by the book every ten minutes, we don't care what you call yourselves in between." During the conversation I casually mentioned that a club member used his ham call as a CB 'handle' when travelling. His answer was, "Since hams use callsigns interchangeably as personal names, that makes perfect sense to me." He added a comment to the effect that if the FCC gave a good gosh darn how people ID'ed on CB, they'd still be issuing callsigns.

1. I wish someone would take a survey to put accurate numbers on it, but I would guess that the OVERWHELMING majority of ARRL 'members' think of it as subscribing to QST and dismiss the organizational stuff as trivial.

2. People don't bash the ARRL for no reason. People bash the ARRL because it has for decades maintained an unblemished record for screwing up. They have resisted every improvement or advance to come along until after it was obvious that they were the last holdouts.

3. People don't join for a variety of reasons. Mine is I can't afford $30 a year for a magazine subscription.

Ok, I know a ham out there somewhere has got it, so, please:
I am in dire need of a satellite tracking program, hopefully
in basic, that prompts for the user's lat, long, and keplerian
info of a satellite, then outputs the altitude and time the
satellite will be visible for the observer. Anybody?

| overhead of synchronization using semaphores does a good job of
| gobbling up substantially more than a 10 MHz 68010 (my AT&T 3B1).
| I made a change to interlock using a test-and-set instruction
| on some shared memory before trying to get a major semaphore..it
| increased the efficiency of the package enough so that it
| is reasonably snappy, but I've had problems with synchronization
| not working properly, so I can't call it a success.
+---------------

I'm working on a complete reimplementation using Streams for SVR3. It is
based on raw Streams, not the NSL, so it should work on any System V that has
Streams support --- and some that claim not to, like Xenix 2.3.x without the
appropriate network package. (I'm doing this under Xenix 2.3.3.) Of course,
this won't help on a 3B1, which is SVR1 in the kernel.

(Actually, I'm still trying to decide how much I should do at the Streams level
--- should I simply arrange for local sockets and use ordinary programs to do
the real work, or put AX.25, NET/ROM, and TCP/IP in Streams modules and have
the far end be selectable between a "bidirectional Streams pipe" and a real
Streams tty driver? The problem with the latter is that it isn't particularly
easy to implement something like NOS's "ax25 route add" command.)

Yes! As I and others have said before, experiences from countries that
do have no-code licenses, for many years now, show that this simply
doesn't happen. After a while, you will find that LIDs equally divided
in all license classes. A number of local people I would call 'difficult'
(nor does any other test, IMHO).
have a full ticket here. The code test doesn't make a difference.

What will change next year?
If the amateur literature printed by a ham union is representative
for the work done in that country, then I guess UHF/SHF activity
will go way up. That is a Good Thing.

What will turn people away is a negative attitude. If you have a problem
with certain people, just QSY and keep everybody happy. Fortunately, there
is still enough frequency space left to do that. Even, you American people
still have a big allocation advantage.

Getting a whole flood of new people will put some pressure on the patience
of everybody.
Just wellcome the new people with a positive attitude, friendly point them to
the operation errors they make (like you made them in your first QSO),
and after a while you will find out that there are many people
for who you're glad they joined the radio service.

Real hams don't get mad at somebody with a bad fist. They will try to make
the code of that person better. The same thing applies here.

Best wishes for 1991! 73,

Geert Jan PE1HZG

I am in need of a copy of The Boomless Quad article that appeared in CQ
mag. somewhere between April-June of 1981-1983. I am not sure of the date
exactly but I am sure it was in CQ because I built it some years ago.
If anyone has the issue in question, I would like to arrange for a copy
of it. I am particularly interested in the dimensions since I would like
to rebuild the elements and put it up. Please contact me via e-mail or
write me at: P.O.Box 1286 Lakewood, NJ 08701
AMPR: KA2RAF@NN2Z.NJ.USA
I am willing to pay any expenses for the copying/postage
Thanks very much, 73 de Chris

=========
SpaceNews
=========

MONDAY DECEMBER 31, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States. It is published every week and is made available for unlimited distribution.

* UoSAT NEWS *
==============

The launch of six microsatellites designed and built by dedicated amateur radio operators from around the world was the most significant amateur satellite news event in history. These six microsats flew as secondary payloads on the European Space Agency's V-35 mission on 21-Jan-90. Twelve minutes after liftoff, the Ariane launch vehicle placed these six satellites into Earth orbit. UoSAT-3 and UoSAT-4 alone carried a total of 9 microprocessors and 5000 kilobytes of RAM. That's more computing power than had ever been launched by one rocket!

UoSAT-3 (OSCAR-14) carries a 16-bit embedded microprocessor controller with 4.5 megabytes of RAM. UoSAT-4 (OSCAR-15) carries the first Transputer parallel-processing microprocessors in space. UoSAT-3 is currently being used to test new "PACSAT" communications software. UoSAT-3's PCE uses a multi-tasking operating system created by Quadron, Inc., which was specifically designed for communications intensive systems.

UoSAT-4 (OSCAR-15) carries three microprocessors and a CCD Earth imaging camera. Parallel processing available on the spacecraft will provide high-speed compression of camera images. Tests of radiation tolerance of the Transputer chips used will also be made.

* ITALIAN MICROSAT *

Work continues in Italy on a new microsat amateur satellite. During the first week of December, the transmitter module, BCR module and CPU were all integrated and the PHT software was run succesfully, controlling each different module. The PSK transmitter has been tested at varous power settings, showing excellent linearity and the telemetry frames has been received by many stations in the 50 km radius of Rodano (Italy), where the engineering unit of the spacecraft is being integrated. A completed unit is expected to be ready by the end of Janaury after all tests are complete.

* BADR-1 DECAYS *

BADR-1, a Pakistani satellite launched by the People's Republic of China earlier this year, decayed in the Earth's atmosphere between 08-Dec-90 and 09-Dec-90. BADR-1 transmitted telemetry using an FM carrier in the 2-meter amateur radio band on frequencies of 144.030 and 145.825 MHz. It was never determined why this spacecraft used amateur radio frequencies for its downlink of telemetry since it clearly was not an amateur satellite.

I have an old Icom 4AT which has been collecting dust for several
years now (remember when radios had thumbwheel switches :-).

The production company I work for uses low-power 450 & 455 Mhz xmitters
as sort of a wireless intercom.  I was wondering if there's a way to
easily shift everything "up" by 10 Mhz and have the Icom cover 450-460 Mhz
instead of 440 - 450 Mhz.

Please, I'll just be using it for reception so no flames about
FCC Type acceptance :-).

On a related note, I missed the ALLMODs post that was here awhile back; Is it
FTPable ?  I checked Simtel-20 and couldn't find it.

Lines: 97

After listening to all the belly aching about the codeless license, I decided it is time for the Eccentric Old Hippie to toss in his dos centavos.

It seems that even the opposing sides in the 14.313 war are unified in their hate for the idea of a codeless license, and are bemoaning WHAT WILL BECOME OF HAM RADIO (Hawr hawr just listen to 14.313 for a few days and you will realize it can not get worse than THAT)....

I think the FCC is one heck of a lot smarter than those old rickity coots at ARRL. The code free license that ARRL proposed would have brought in NO ONE. Plain and simple, that ticket had no value, and the FCC is wise enough to see that. Here are these grinchy coots wanting to hang on to all the "good stuff" like 2 meters for themselves.

WHAT ON EARTH FOR? Maybe there is a lot of fascinating 2meter discussions where YOU live, but my experience is that NEW BLOOD is NEEDED, and without this transfusion, the patient is gonna die.

I have a 2 meter all mode radio. I can tune it from one end to the other most of the day and hear NOTHING. Granted I live in the hinterlands, but I got this radio for $100 (some folks say I stole it from the other op) because the guy who had it could find no one to talk to. HE LIVES IN CHICAGO.

I have two friends who I work on this radio SIMPLEX. I guess that makes it worth the $100.

I also have a CB. (EEEEEEEEEEEEEEK) On there I talk to about 6 very conversant folks about all sorts of fascinating topics. We have talked for HOURS AND HOURS on 27275. For at least three years, I have been pestering them to get ham tickets. They all have scanners and shortwaves and they listen to me talk to my ham friends, and also follow some of the more off the wall nets that I am a member of. They find it interesting, but none of them ever got sufficiently motovated.

Until now.

One of the group has already stated that come february he will be taking the plunge. I am figuring that once HE does, several of the others in the 27.275 group will also join in (There are THREE of us in the group that are already hams, but find the CB group more handy)

When I was a KID I thought the ARRL was great. They provided me the study guides, and back then QST was something a person did not need a bank loan to get.

I dropped out of ARRL when INCENTIVE LICENSING came about. I think NOTHING destroyed ham radio like INCENTIVE LICENSING DID. If you look at the figures I will wager that the decline in ham radio happened RIGHT THEN and there.

The new tech license will go a long way toward making up for the stupidity that caused the decline in ham radio activity.

I think it is time we old timers wake up and smell the coffee. I am in my 40's and I am the youngest member of most of the nets I am on. I used to remember in the 50's and 60's always hearing high school and college age kids on the ham bands. I don't think there is anyone younger than 35 on the local ham bands, and I do not recall hearing very many youthful voices on 20 40 or 75 either.

My Code Key is still connected, and I still use it... I sort of like the "tradition" of the original digital mode....

However, all those "usual" CW arguments started sounding very very stale to me 10 years ago; (You can use it in an emergency if your mic is broken) Hey lets make it manditory for DRIVERS also, so if they get stuck in a rollover in a valey, they can beep out a message.... (CW always gets through) packet gets through better, and it is ERROR FREE and you don't have to listen to a "lake erie swing" either....   etc. etc. etc. ad nausium.

I operate a fairly popular BBS system, which is radio oriented. All our staff are radio nuts of one variety or another. I am personally going to develop an on line study system based upon the new code pool. It will feature tutorials, an on line test, with help on the questions you missed.

I want to personally elmer in a SLEW of new ops, and so should the rest of you.

At least here on USENET, there has not been the sour grapes doom and gloom griping.

"Ham radio will become like CB"

Well I tell ya folks. Listen to 14.313 and then come to Marquette Michigan and tune in 27.275. Compare the two. Then say "Boy would it ever be a good thing if it *DID*"

RTTY DX Notes 1of3 12/28/90

RTTY DX Notes for week ending 28th December 1990
BID: $RTDX1228
Part 1 of 3.

So that was Christmas. We hope that you all had a very happy, joyous and loving time with your families . . . and so to the New Year. May it be peaceful, prosperous and healthy, and hope it will be better than the years that have passed. We would like to see all that you have wished for come true, to yourself and your friends. For myself, i wish for a packet system that will handle traffic, irrespective of length, which will not need to split it into small parcels. That will save a lot of hassles. Have a happy year, chaps.

Our thanks this week go to DJ3IW and the Saar-Pfalz DX-Club Packet Cluster, JA1BLV, OD5NG, TG9VT, UT5RP, VK2EG, W2JGR and the Tri-State DX Packet Cluster Network. Thank you all for your help in the past year, and may you all have a very happy 1991.

SB RTTYDX @ ALLBBS $RTDX1228B
RTTY DX Notes 3of3 12/28/90

RTTY DX Notes for week ending 28th December 1990
BID: $RTDX1228B
Part 3 of 3.

QSL Information:

UL7LR says to QSL to Box 97, Dzhetygara, 459430, Kazakh, USSR.

KD7P/KH7 and KD7P/KH2 QSL via Bob Winters, MOU3, PO Box 8265, Dededo, Guam 96912-8265 USA, and not KA2XX as previously stated.

V31JV has a QSL manager of N4RNR, Silvio Marini, 880 Wynnehurst St, Pensacola, FL 32503-2440.

ZS9Z says to send his cards to ZS6BCR.

KP2N is managed by WA4WIP, Richard G. Tesar, 3903 Linwood St, Sarasota, FL 34232-3727.

ZD8BOB is still at Box 2, Ascension Island.

9M6/JH1ROJ says to QSL to his home address.

LX150 is a special call and will collect his cards from LX1OA.

Notes of Interest:

4X6UP says that 4Z80TA will operate for two months to celebrate the 80th anniversary of the municipality of Tel Aviv.

YA0RR (Afghanistan) expects to start operation from January 1, (after dinner). He will be there for three weeks and will spend at least 10 (ten) days on RTTY. Dima (UT5RP) will handle the RTTY QSL chores only. Don't send him CW or SSB cards.

FL5/XE1L (Luis) is on Mayrean Island in the Grenadines. He hopes for it to be clasified as a new country for DXCC when he submits his application. We are not sure if he has RTTY, but WFWL.

HF0POL is reported as being active from King George Island, but no reports of RTTY activity.

Swiss stations will be alowed to sign the HE prefix after January 1.

The OT prefix is the same as the ON prefix.

And a very happy New Year to you all.

GL DE DX1 (VK2SG) AT TG9VT.

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.
Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU, or via the VK2AGE AMTOR APLINK mailbox system.

Subject: Home Escort (the portable electronic jail)
Summary: How does the "Home Escort" device work?
Keywords: radio house-arrest
Message-ID: <19591@netcom.UUCP>
Date: 29 Dec 90 18:09:16 GMT
Distribution: usa
Organization: Netcom- The Bay Area's Public Access Unix System {408 241-9760 guest}
Lines: 22

I've recently heard some about the "Home Escort" device which is used to keep track of convictees at home in lieu of putting them in jail.

The device consists of three parts: A leg bracelet worn by the convictee (for lack of a better word), a radio device in a black box with two nine inch whips on it which communicates with the bracelet and is attached to a large console which is then connected to the phone line and makes a call to a central station approximately every four hours at 300 baud.

Now, having seen the device, I am curious about what frequencies it uses to communicate with the bracelet and how it talks to the central station, i.e., what it says to the station (and what the station says in return) and how.

Searching the low-power police freqs have so far turned up nothing from the unit and I'm growing curiouser and curiouser about it.

BTW, the unit is made in Colorado and is FCC registered but that's all the info I have been able to come up with.

Thanx,
jd

I have yet to talk to anyone for whom one of the Spectrum International

filters has made a whit of difference. I have one here, and my experience
has also been that it doesn't knock the desense down whatsoever. I went to
a cavity filter which works great. Desense on Mode J seems to be dependent
on a number of factors; some stations have problems, while others, using
virtually identical equipment, have none. I'd recommend getting on the
air first, and, if you have a desense problem on Mode J, then get yourself
a 70cm cavity centered on the appropriate frequency.

I am interested in finding out technical information on beverage antennas. I know that a beverage is a long wire, a few wavelengths long, about 6 or 7 inches above the ground. I think that the antenna is terminated somehow. I heard that they are used in broadcast band dxing and that people have had fantastic dx usine the antennas. I would be interested in any technical information on beverages, construction, problems, etc. I would in addition like to hear from people who have used beverages while dxing the am broadcast band. Any information would be appreciated.

I am setting up a CB in my house, and I am having problems with a ground plane. The equipment works fine in my car, so I know its not broken or anything. I want to put the antenna on my roof, but I am having trouble finding a good ground plane. The manager at Radio Shack suggest getting a peice of sheetmetal for a ground plane. How big should I make the sheet metal?

(lots deleted)

>In high school I had a crusty old teacher who was adamant that without a
>"thorough grounding" in Latin and Greek it wasn't possible to get even a
>rudimentary education.

I can't argue with that, but I've noticed that the level of education that graduating students seem to have has dropped considerably over the years.

>The question is not one of "lowering standards" or "killing CW" but of
>testing for something relevant to the privileges granted.
>
>Airline pilots don't need to learn CW, but all the same the
>testing/education process seems to produce a reasonably competent breed!

When I took my pilot training in the Air Force, CW was a requirement. At least, you had to learn the characters. This was because the radio station identifiers were sent in Morse. One of the first things you learned in instrument flying was that you must be sure to identify the station you tuned to make sure you didn't fly to the wrong place. You did this by listening th the station identifiers.

There is no "airline pilot" exam as such. These folk get there after a long laborious grind, either through the military or through the progression from Student Pilot, Private Pilot, Commercial Pilot, and Airline Pilot. Each step carries with it certain experience requirements, as well as more intense medical and knowledge requirements. The Morse code is no more than just a part of the "early learning" process.

Nowadays, many (if not all) stations use voice identifiers, so there may not
even be a requirement to learn the morse characters now.

I'm at a loss to understand this posting.
If I read it properly, Carl Hovey, who allegedly has
an Advanced license, and a rig, albeit one opf
of the highly touted and heavily advertised
Jap riceboxes (admittedly the Icom lines have
significantly better performance than the even
more heavily advertised Kenwoods, which in turn
are infinitely better than the recent Yaesu line,
which isn't saying much) and a couple of wire
antennas, which should work on a few bands.

[let's start a new sentence even though the last
one isn't especially complete.]
With the rig, which hopefully is operative, meaning that
it should receive "something" and likewise be able to
transmit "something" and a key or microphone, preferably
the former, as CW is the real HAM's mode, and some sort
of power, whether via battery, portable generator, or
maybe even Oregon Electric Co. or whatever outfit owns
the meter and the poles, etc. and the desire to make
contacts, I recommend:"

Said relative fire up the rig, tune around and find someone
calling "CQ" and answer same.
Or maybe even trying calling "CQ" himself and seeing what
happens.

I've done that for a couple of years, and it always seems
to work.

Or maybe somebody had misposted the item.
Rec.humor, perhaps.\?

Am I missing something?

73, etc.

If this is properly expanded, the answer can be found by reference to the ARRL Handbook, l985 edition, page 13-2.
There is an extraneous reference to section 97.27 of the FCC rules, which I admit I don't understand.

It's obvious that someone hasn't done his homework.

73 and happy new year.

QST DE W1AW
ARRL BULLETIN 55 ARLB055
FROM ARRL HEADQUARTERS NEWINGTON CT
DECEMBER 29, 1990
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

FCC announced on December 27 details of the new code free Technician license. The license will carry full amateur privileges above 30 MHz. The new regulations are effective February 14, 1991. Current licensees of all classes, including existing Technicians, will neither gain nor lose privileges. The Novice license will continue to be available to new applicants. Further information will appear in the February issue of QST.

QST DE W1AW
ARRL BULLETIN 56 ARLB056
FROM ARRL HEADQUARTERS NEWINGTON CT
DECEMBER 29, 1990
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

FCC ruled on December 27 on exempting applicants with disabilities from the 13 and 20 wpm Morse examinations. Applicants upgrading to a license requiring these code levels may present to VEs certification from a physician to be exempted from the CW requirement. Only certification by doctors of medicine and Osteopathy will be accepted. Applicants will also be required to submit a release allowing FCC access to appropriate medical records. The new regulations take effect February 14, 1991, though waivers of 13 and 20 wpm code tests are already available under similar conditions. More information will appear in February QST.

QST DE W1AW
ARRL BULLETIN 53 ARLB053
FROM ARRL HEADQUARTERS NEWINGTON CT
DECEMBER 13, 1990
TO ALL RADIO AMATEURS

FCC ALSO ANNOUNCED ON DECEMBER 13 THAT IT HAS AMENDED ITS RULES TO MAKE THE AMATEUR SERVICE MORE ACCESSIBLE TO HANDICAPPED OR DISABLED LICENSEES WHO ARE UNABLE PASS HIGHER SPEED MORSE CODE EXAMINATION. THE FCC DECIDED TO DECLINE TO PROVIDE A LIST OF DISABILITIES. INSTEAD, THE JUDGMENT IF A QUALIFIED PHYSICIAN WILL BE RELIED UPON TO DETERMINE THAT A PERSON CANNOT PASS A MORSE CODE EXAMINATION DUE TO A SEVERE HANDICAP.   IN RESPONSE TO CONCERNS ABOUT THE INTEGRITY OF THE PROCESS, FCC STAFF SAID ANYONE ABUSING THE PROCESS WOULD BE DEALT WITH HARSHLY. THE FCC AFFIRMED THAT BECAUSE OF INTERNATIONAL REQUIREMENTS, NO EXEMPTIONS WOULD BE GRANTED FOR THE 5 WPM MORSE CODE REQUIREMENT

QST DE W1AW
ARRL BULLETIN 52 ARLB052
FROM ARRL HEADQUARTERS NEWINGTON CT
DECEMBER 13, 1990
TO ALL RADIO AMATEURS

THE FEDERAL COMMUNICATIONS COMMISSION ON DECEMBER 7 DENIED AN ARRL PETITION FOR RECONSIDERATION OF THE COMMISSION'S RULES

REGARDING OPERATION OF NON-LICENSED RF DEVICES. NEW STANDARDS IN
EFFECT SINCE JUNE, 1989, CONCERN RADIATION FROM EQUIPMENT RANGING
FROM RADIO RECEIVERS TO DOOR OPENERS. THE COMMISSION CONCLUDED
THAT THE NEW REGULATIONS DO AFFORD ADEQURTE AND APPROPRIATE
INTERFERENCE PROTECTION TO THE AMATEUR SERVICE. FURTHER
INFORMATION APPEARS IN THE JUNE, 1989 ISSUE OF QST

|
| When I took my pilot training in the Air Force, CW was a requirement. At
|least, you had to learn the characters. This was because the radio station
|identifiers were sent in Morse. One of the first things you learned in
|instrument flying was that you must be sure to identify the station you tuned
|to make sure you didn't fly to the wrong place. You did this by listening th
|the station identifiers.
|

I don't know about the Air Force, but there is no *civil* requirement to
know morse as a pilot. The station identifiers are still often in morse,
but the dot-dash pattern is printed right on the chart..

12 years of flying didn't help much on my Novice code test :-)

Some, and not even many, use voice. The main VOR's have voice on them, but none of the NDB's or ILS's I know of do. And it is more important to know which ILS you are receiving than the VOR. But both are important.

Pilots cheat, however. The charts include the dots and dashes along with the letters. All you need to do is match the pattern.

It rather depends on your equipment's ills. If you have a 2 meter transmitter
or amplifier that puts out broadband noise, a common problem, a 2 meter
filter on the 2 meter output will do wonders while a cavity on the 70 cm
side won't help at all. If your problem is poor out of band strong signal
handling on the 70 cm receive side, then a 70 cm cavity will help. Some
setups need one, some the other, and some don't need anything at all.
When I was running an IC211 and an IC451A, I didn't need a filter at all.
With the current TS790A, I need both. :-(Anybody want a slightly used
TS790A? I'd love to trade up to an IC970 or an IC275, IC475 pair. :-)

>
>I am interested in finding out technical information on beverage antennas. I know that a beverage is a long wire, a few wavelengths long, about 6 or 7 inches above the ground. I think that the antenna is terminated somehow. I heard that they are used in broadcast band dxing and that people have had fantastic dx usine the antennas. I would be interested in any technical information on beverages, construction, problems, etc. I would in addition like to hear from people who have used beverages while dxing the am broadcast band. Any information would be appreciated.

A beverage is a unidirectional antenna with gain for receiving only. It is normally several wavelengths long and is mounted a few *feet* above the ground. The far end is terminated by a 400-900 ohm resistor. The antenna is unidirectional in the direction pointing toward the terminating resistor. Mine are 1/4 mile spools of electric fence wire, mounted about eight feet above the ground, attached to trees in the woods beyond my house. Four feet would be a more ideal height with my soil conductivity, but I didn't want deer to get tangled in the wires. The terminators are about 800 ohms in my case. I have a rotary switch, with compass rose, setup to select the proper antenna to feed an adjustable L network that feeds the receiver.

The theory behind the Beverage is somewhat controversial. The Beverage seems to work similarly to a directional coupler. Signals arriving from the direction of the receiver end couple to the antenna and are dissipated in the terminating resistor at the far end. Signals received from the direction of the termination go into the tuning network and the receiver. Surprisingly high front to back ratios are achievable. I have seen a more than 20db indicated signal strength change by switching from one Beverage to another. The antenna's performance seems to fall off rapidly above 4 Mhz. At MF and LF it is wonderful.

A few tips. To properly adjust the terminating resistor value, select a station off the back of the antenna and have someone adjust the termination for the best null. I use ordinary carbon pots as terminations. Don't worry about the exact length of the antenna as long as it's more than about eight wavelengths at the lowest frequency of interest. Ordinary resonance effects seem to damp out beyond that length. The L network should be designed to match 400-900 ohms to 50 ohms. Tune it for the loudest signal. Install a knife switch at each end of the antenna so that you can ground it when not in use. A 1/4 mile of wire picks up a heck of a charge in an electrical storm. I've lost several terminating pots due to failure to hike out and short the far ends to ground.

Much has been said, mostly rumor, in this newsgroup about the ARRL's possible reaction to the recent FCC decision in PR Docket 90-55, Codeless License. Posters have accused the ARRL of being a "spoiler" on this issue and out of touch with "real" hams.

Perhaps we can get some meaningful information from somebody actually in the ARRL. Last evening, I attended a very nice dinner for alumni of the University of Maryland ARA. In attendance was Hugh Turnbull, W3ABC, Atlantic Division Director. Since there were at least 3 regular readers of rec.ham-radio (a.k.a. Info-Hams Digest) at the dinner, we asked him of the ARRL's possible response to the decision.

Hugh said that the ARRL still wanted to sit down with the full Report-and-Order and hash out precisely what differences exist between the original proposal and the one returned by the FCC. This is understandable, as they want to clear away the smoke of rumor and consider just what the impact of the new FCC regulations would mean.

Hugh DID say that the ARRL would be VERY reluctant to file an Appeal for Reconsideration, as to do so would cast the ARRL in the role of spoiler (maybe they aren't so out of touch after all???). What would motivate them to appeal would be a feeling that there were significant parts of the new regulations that would be EXTREMELY DAMAGING to amateur radio.

To extrapolate from what Hugh said, the decision on whether or not the ARRL would file an appeal would be on two points:

1. The impact of the additional privileges (i.e. 2m and 6m) that were not initially proposed.

2. Whether or not the new regulations would be EXTREMELY DAMAGING to amateur radio.

In previous conversations with Hugh, he expressed a concern over potential TVI problems between 6m and fringe-area Channel 2 reception. This was a key factor in the ARRL not asking the FCC for 6m privileges. There was also concern about excessive band loading on 2m.

Hugh says that comments on the issue have been split right down the middle. He is very concerned that the new regulations will divide amateur radio. He brought up 3 key goals of license restucturing, and why he felt that the new license might not be of significant impact:

1. An influx of new, quality hams. Any new restructuring in and of itself will not dramatically increase our ranks. No-Code is not a panacea and it should not be though of as such. Any serious effort to recruit new hams with this new license should be accompanied by an appropriate recruting/PR effort. VE's turning in their accredidation over disagreement with the new license will not achieve this goal.

2. A dramatic increase in amateurs on the UHF and Microwave bands, to prevent licensed and unlicensed encroachment on our bands from Part 15 devices, HDTV, cellular phone, satellite communications, etc. Giving away the lower VHF bands to new hams might give us the same band loading problems, only more so. The ARRL felt (whether you agree with it or not) that a 220-and-up license would force new hams to break new ground on the upper bands.

3. Acceptance and assimilation of these new hams into the mainstream of the hobby. Again, bitter divisiveness, shunning, old Tech's using a /C suffix, and other childish games will not make these new hams feel welcome. If this new license, as sensible and well though out as it may be, causes more divisiveness and infighting (possibly played out on the ham bands), then it may hurt more than help amateur radio.

As was stated previously, the stream of comments coming in to League officials on the issue have been split 50/50. If you write the ARRL, and I encourage you to do so, please consider the following in your letter:

1. Will 6m TVI be a problem? Why/Why not?

2. Will 2m band loading be a problem? Why/Why not?

3. What recruitment efforts do you and/or your club have in place to test, train, and accept these new hams?

4. What kind of impact will this new license have on use of the UHF and Microwave bands?

5. Will the new license cause a splitting of hams into code/no-code camps? What can you and/or your club do to make these hams feel welcome and smooth over ruffled feathers among existing hams?

Sorry this post is so long, but I had to get in all the information. Please don't flame/write me, flame/write the ARRL.

73, Paul W. Schleck, KD3FU

On December 13th, the FCC modified the requirements for the Technician Class license by dropping the code test. This bold move offers great hope to all of us who are deeply concerned with the possibility that amateur radio will one day soon be crushed under the weight of the spectrum needs of other services.

I was disturbed to note, however, that you were reported to be considering asking the FCC to reconsider this action to the extent of confining the new codeless Technicians to 222 mhz and up. I consider this most unwise for the following reasons:

One basic Technician Class license with one written exam + a CW endorsement for those who want to operate on HF would be easier and cheaper for the FCC to administer.

"Ghetto-izing" the codefree Technician Class licensees provides no regulatory or technological benefit. Rather, it serves only to codify social discrimination by preventing the newcomers from coming into contact with the majority of their fellow amateur operators.

Amateur radio constitutes the United States' first National Park of the Mind, and broad, open access to that public resource will provide intellectually stimulating and spiritually refreshing benefits to the nation that narrow, inhibitory access by the privileged few cannot. I believe that that is the basic reason the FCC made its decision.

Amateur radio's greatest contributions to the state of the art occurred during the period of its early history when it was not straight-jacketed by complex regulations and licensing structures not based on compelling need. Preventing or inhibiting the freest possible exploration of the National Park of the Mind consistent with conserving its meaningful existence would tend toward reducing it to the site for historical tableaux similar to those re-enactments of medieval jousting.

There is no compelling need for creating your proposed codefree ghetto. Therefore, any request for reconsideration will doubtlessly be rejected out of hand. The only result of a Petition for Reconsideration will be to make the League look foolish.

Moreover, since the new codefree amateurs are going to revitalize the future of ham radio, resentment against the organization that attempted to cause part of the original promise to be withdrawn would no doubt result in very few of them joining the League, which would very likely become little more than the custodians for its Antique Wireless Museum.

To summarize, it's a dumb idea.

Knowing Morse _did_ help on my Private Pilot checkride...

It's _real_ nice to be able to tune and identify a navaid while keeping my
eyes out of the cockpit, especially in Houston's busy terminal airspace.
Unlike Dube Todd, I've _never_ met a navaid with a voice ID.

I wouldn't mind having a Morse requirement for a pilot's license...

Speaking as one with muscular dystrophy, I find your total insensitivity to be objectionable and offensive in the extreme.

And to think, your callsign indicates that you are one of these highly superior Extra Class licensees. You, my friend, are a living example of what we've been saying here - learning code is not a measure of intelligence or education.

Indeed, I'm beginning to wonder if the opposite may be true. It is a recognized phenomenon of psychology that people with certain severe brain disorders can be taught to perform simple mechanical skills with a high degree of proficiency. The theory, I guess, is that higher order brain functioning does not help and may even hinder the accomplishment of skills that do not require reasoning ability. That would certainly explain you and your fellow Penn Wireless Association members.

Wigi, AL7IF, is having trouble posting to the net and asked me to post a request for information on satellite tracking programs for the Macintosh.

He's interested in both commercial and public-domain programs. I know of a few (see list below), but I haven't actually tried them myself. If you have any comments on the ones listed below or any others, please post them for the good of the masses or send them directly to Wigi at "wigi@tybalt.caltech.edu".

Thanks!

Patty

Macintosh satellite tracking programs:

QuikMac
AMSAT, PO Box 27, Washington, DC 20044. $40 for AMSAT members; $50 for non-members. Requires Microsoft BASIC.

Satellite Orbit Prediction Program
Macintosh conversion of W3IWI program.
Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015.
Send formatted 800K Macintosh disk with stamped, self-addressed return disk mailer; or send SASE for source listing. Requires Microsoft BASIC.

MacSat
BEK Developers, 1732 74th Circle NE, St. Petersburg, FL 33702.
$10.00

Satellite Helper
MacTrak Software, PO Box 1590, Port Orchard, WA 98366. $59.95

Satellite Pro
MacTrak Software, PO Box 1590, Port Orchard, WA 98366. $99.95

Collections that include satellite programs:

MacNet
Public-domain programs (currently on nine disks) contributed by Macintosh packet users. Includes test preparation, contest logging, propagation prediction, satellite tracking, and amateur television.
John D. Seney, KB1HE, 144 Pepperidge Dr., Manchester, NH 03103. Send formatted 800K Macintosh disks with stamped, self-addressed return disk mailer. Contributions of public-domain programs encouraged.

"Project Mac"
Contest logging, antenna design, satellite tracking, clip art, etc. Microsoft BASIC required for many (but not all) of the programs.
Stan Horzepa WA1LOU, 75 Kreger Drive, Wolcott, CT 06716. Send three formatted 800K Macintosh disks with stamped, self-addressed return disk mailer.

"Amateur Radio Software for Macintosh"
Extensive catalog including logging, Morse code, Novice, gray-line, satellite tracking, contesting, packet, and CW programs.
ZCo Corporation, PO Box 3720, Nashua, NH 03061.

Amateur Radio #1
Contains satellite tracking, Morse code practice, Ohm's law calculator, and pad design programs.
Kinetic Designs, PO Box 1646, Orange Park, FL 32067. $4.00

Ham-oriented landline BBSs that may have satellite software:

MacScience BBS
Various ham-related applications, including antenna design, propagation, WEFAX, packet, and Morse code. (408) 866-4933.

Digikron Systems BBS
Various ham-related applications, including logging, propagation, Morse code, and packet. (408) 253-1309.

WB3FFV BBS
Various ham-related software, including packet, contesting, and Morse code applications. (301) 625-0817, 625-9482, and 625-9663.

N8EMR BBS
Various ham-related files, including packet, Morse code, DXing, and contesting software; AMSAT bulletins; and several ham newsletters. (614) 895-2553. Also available on AMPR.NET at 44.70.0.1.

>heard that they are used in broadcast band dxing and that people have had
>fantastic dx usine the antennas. I would be interested in any technical info-

The Beverage antenna was conceived decades ago as a transmitting antenna (primarily) which provided a low angle, unidirectional pattern. Ham radio books such as the ARRL Antenna Book will have more information about this design. It appears to me to be a somewhat specialized, dedicated purpose type antenna setup that wouldn't be useful for dx reception from diverse directions. Also, an antenna several wavelengths long at broadcast AM frequencies could begin to be a mile in length.

The all time best AM broadcast band DX antenna would be an active loop antenna located some distance from the house, electrical wires, etc. The loop would of course be remotely rotatable. The gain of this setup would be such that the baseline atmospheric noise it picked up on the quietest night would just override the receiver's internal noise. The long antenna you propose would tend to cause a receiver dynamic range problem without any real DX benefit.

Personally, I use a homemade wideband active antenna located about 100 feet from my house. This does MF and SW through 30 mHz. For MF (AM broadcast), it would be better if it weren't omnidirectional, but I was too lazy to put a rotatable loop outside. It is very important at MF to get away from noise sources.

Now if you want to talk FM DX, I got all sorts of specific ideas for that (I'm chief engineer of KWSS-FM, San Jose, CA)!

I have the misfortune of being a ham stuck in a basement apartment (half underground actually and two floors above) I have been trying to come up with some kind of radiator which does not extend out of the apartment (rules from the management).

The only thing which seems to be possible at this point is a dipole wound on a pole with some kind of matching network.

Thus, two questions:

1) Any other system which might work well
   (I would like 20 meters but will live with 10)

2) Suggestions for a cheap or easy to build transmatch
   which can handle the output from my Kenwood 820
   (About 200 watts max)

Please mail me directly as I am trying to catch up on my newsgroups but it is quite a battle...

What kind of a person would not go through learning the code to become a
ham radio operator? ...Certainly no one who we would want to see on the
air....

Its easy as walking down your own hall to learn code... heck if I could do it _anyone_ could do it.

...Besides _I_ had to learn the *&^%$%# code, why give these wannabe newbies a break?

Can you immagine what kind of person will be drawn into this hobby of ours if the nocode techie license comes in, I can see it now the pirate CB bandblaster type screaming breaker 19 for a bear on the side.... The code has kept this kind of person out for 20 years. Lets keep it that way.

...I wont even *talk* to a guy who gets a no-code techie license, I know of no _real_ ham who would even bother with people of this ilk.

Though in places the above was deliberatly overstated, the feelings put into words above have seemed quite prevelant on this newsgroup since the news release by the ARRL and the FCC relating to the new no-code ham license. This is not to say that all of the users here have been this way, in fact there have been some downright gracious posters who say they will be welcoming those of us without code class licenses with open arms. To them I say, thank you.

To the others, please consider that many of the people you will be "forced to live with" in this new radio world are not the music broadcasting, foul mouthed band jammers you left on channel 20 of the CB. Many if not most probably want to add to the hobby or enhance themselves through it in one way or another.

I was very serious about getting my ham ticket about ten years ago. I worked very hard studying the theory, the laws, and the code. I found the (novice) theory to be a challenge, but certainly not oppressive, the laws to be a breeeeeze, and the code to be totally insurmountable. I did all the usual stuff including the tapes and the records. I studied books on 'how to pick up the code' that were reccomended by hams who should have known what they were speaking of. I even had a few people help me study the dits and dahhs for hours on end, and after six months of trying, I gave it up as something that my mind just wasnt receptive to. I believe that I was a very comitted student and I did honestly try the best I could to pick it up. The sad fact is that some of us are more oriented to people or art or math while others find these subjects a waste of time and can't concieve of why anyone would spend the time with them.

Instead of becomming a ham, I was forced to be happy listening in on the short wave radio and a couple of scanners. I have learned a lot about dxing from this and no small amount about making and erecting antennas....so it isn't all for nothing.

Now that the no-code license has been proposed, I expect to finally receive that ticket that I tried so hard for years ago. I have a particular interest in disaster preparadness and emergency response. I have a proven ability in these areas and know from experience that I can maintain a calm reasoned thought process when in a true emergency situation. Like others I expect to enjoy the 2 meter rag chewing and the usual bs that most hams play with, but I also intend to give something back to the hobby that not only helps the local community, but can result in damn good press for the ham fraternity as well.

However..... if the vast majoity of the 'old guard' choose to dismiss those of us who are lucky enough to get our no-code tickets, without giving us a chance to learn the ropes and get mature enough in the hobby to give something back to it, you will have a self fulfilling prophecy. You will 'scare' away those who might care and could help the hobby out and be left only with that minority who don't give a damn anyway. I think we can all agree that this would be a travesty and might just bring down a great part of the hobby to the level of alt.flame.

Having said all of that I feel I can now climb down off of this lofty pearch of a soapbox and humbly ask a few questions.....

A) I have been away from the ham side of things for so long that I am even in a quandry as to what to look for as far as books on the subject. I suspect that ARRL still puts out quite a library, but I am more interested in something to help get the license that is less stilted in the ways (and pockets) of the ARRL. There was a set of books out several years ago that essentially took you through what you could expect to see on the exams and gave you a pretty good background on the exam and the possible questions. Do these still exist? Can you reccomend anything else that might be helpfull?

B) My wife and I have talked about her geting into this in a lesser way, mostly to help out with emergency traffic and to keep in touch when we are appart or separated because of an emergency. I vaguely remember something about family members working equipment in times of emergncy, but I can't be certain. Is there a way for her to legally use the radios either in tandem with me during emergency work, or by herself to contact me if we are sepparated due to natural disasters etc? She will probably get her own ticket too thanks to the dropping of the code requirement so this may become a moot point.

C) One of the big draws, asside from helping others, to the ham hobby was the ability to talk across the country and overseas. Since this is not going to be possible for me on the HF bands, have there been any developments in the last ten years that could be of interest to me in this regard? I understand that there is some sattelite stuff open to ham operators, and I am currious about what it might cost to set up a shack for transmission and reception in that area as well as anything else.

D) Keeping a budget in mind, if you had to start all over again buying new equipment for your shack what would you consider buying. I am interested in handhelds as well as base station style goodies. I will not be installing mobile rigs in our vehicles sans the handhelds on the next seat. :-) (Give me a starting place here folks...)

Thanks in advance for your help. If you feel the need to flame
do it by e-mail, if not then any other comments or suggestions you have
would be most welcome.

Charles

Not quite true. Although many of the VOR (navigation) stations do
have voice identifiers, other navigational aids such as ILS
(Instrument Landing System) nav-aids have only three and four
character morse code identifiers.

You are right that morse code, as such, is not a requirement for getting a pilot's license, but a rudimentary knowledge of it is quite helpful.

RE:Macintosh satellite prog

HI WIGI,

I saw Patty's posting about the satellite programs and their availability. I am using MacSat 1.1.3 and I bought it from

BEK Developers
1732 74th Circle NE
St. Petersburg, FL 33702.
for $10.00

I also down loaded an older version (MacSat 1.1) that is the same program from the SIMTEL20 [PD3:<MACINTOSH.APPL>: MACSAT.SIT](wsmr-simtel20.army.mil 26.2.0.74) for FREE!! I'm sure that there are other sites that will allow downloading). The only difference is the one I paid money for had a version that also ran on the Mac II (made use of the co-processor) as well as a version that ran on the 512KE and up (that's two programs for the price of one). The purchased program also came with a manual that has pictures and explanations of the various options. The free program comes with some docs but for $10 it's hard to bear it.

I also got the Amateur Radio #1 from Kinetic Designs that had an earlier version on it (MacSat 1.1).

If you have a 512KE, Plus, SE then you can't use the program that uses the co-processor. The MacSat2 1.1.3 was written for the Mac II + SE30 machines. The MacSat 1.1.3 was written for use on ALL machines above the FatMac (512K).

I have tested MacSat (both versions) output against the Mainframe and the $10 MacSat is equal to the Mainframe's output. The speed of MacSat is much slower (naturaly) but the data is close (down to one tenth of a second and one tenth of a degree).

I hope this answers some or all your questions, give me a shout if you have any more.

For those not familiar with the area, the southern point of Ontario jutting into Lake Erie is the southernmost part of Canada, several hundred miles south of many parts of the lower 48 states of the U.S. They call it their "Sun Porch". Pretty place. Rather like Ohio. [:-)

Thanks to a call from KA2QHD, a new frequency of 15505 is being used by
the Voice of Peace in Bagdad? (ex 500KW freq for Kuwait/no suprise,eh?)
1800Z with American Infidel music like Stones and a non-Zepplin version of
"Stairway to Heaven"...

Anyone know where I can get that on CD??? What a guitar solo...
more info later... they gave a schedule but thier muddy audio
got the best of it....

I was surprised to read that the ARRL is considering opposing the new code free Technician license. This is a really bad idea for at least two reasons:

1) This sounds like a way to eliminate what little good will may remain between the bureaucrats of the FCC and ham radio. The FCC plan gives us a useful code free license class with little or no cost to the government. Cost is everything to the government these days.

2) The idea is a basically a good one.

I've taught a number of Novice and Technician classes, and I've seen first hand the loss of good potential hams to the code. It seems like a lot of folks have a lot of trouble with the code, and an almost equal number have trouble with theory. Now I can get the ones with theory problems on the air as novices, and the code haters can go straight to tech. I am sure that anyone who takes the time to learn the theory to the technician level has more than a casual interest in radio, and won't abuse the our privileges. This will be really great for schools, who can more easily justify "time on task" for study of electronics than for study of an economically useless skill like code.

I urge everyone to contact your ARRL director and urge them to support the FCC code free proposal.

73,

Jim Howard, N4WBO @ N4HOG.VA.USA.NA

Well said, sir! Any radio amateurs who will not tolerate modernization of the license requirements are digging the grave of the Amateur Radio Service.

To put it bluntly,
(1) We are no longer training the Signal Corps for World War I;
(2) The FCC does not give us spectrum primarily to preserve traditions.

I use CW myself; it's a nice mode, but it's no longer the only mode we've got. I sometimes think the no-code license would have been easier to introduce in 1950 than in 1990; 40 years of ossification have set in, and too many hams have gotten the idea that licenses are a matter of tradition or simple drudgery rather than technical qualification!

The question I would put to those who continue to oppose no-code (including, perhaps, some of the ARRL leadership) is this:
Will there ever be a time in the future when license requirements are different from what they are now? Do we modernize, or do we fossilize?

I thought about no-code for a long time before taking a position on the issue. Apparently, this is a very rare practice; most people made up their minds before they knew exactly what was proposed or why.

I came out only mildly in support of no-code, but I'm gradually turning into a raving fanatical defender of the no-code license simply because the things that are said *against* it are so dumb!

Welcome to amateur radio. Let me know if I can help. vy 73 de N4TMI

If you noticed, I mentioned that as I understand the farcial waiver business
I'd have no big trouble getting a waiver myself. Of course I didn't - was
about 30 years too soon getting the X.
What does Frank Spicer - totally blind and deaf, and no youngster either - thinkof
it? Ask him. He EARNED his Extra.
Do you remember Clif Korne, K9EAB, now S.K., the ultra proficient ham in the
iron lung? He didn't need a waiver; probably couldn't have got one because
he could pass the test without.

The real answer is: It's true that -maybe- some handicapped persons can't pass
the code test because of some physical failing. It also appears that many
who have no claim to being "handicapped" can't pass the test. It's too damn
bad that each and every one of us can't do everything. There are a hell of
a lot of things I can't do because of physical limitations.
And the whole thing started because Pres. Bush got a bug up his ass and sent
a memo to FCC.

What credentials does the average MD or DO have for deciding whether you or I
can't pass the CW test "because of ***"? Hell, most of them are sloppy about
deciding who's qualified for a handicapped parking permit.

I will repeat: it's a farce. Is your muscular distrophy limiting you
more than Frank Spicer's blindness/deafness? Or maybe K3KTH. I haven't heard
or seen ofhim for a few years, but had the pleasure of meeting him often many
years ago. Bill was, of course, wheelchair-bound; restrained because of his
spastic condition. Intelligent? No, brilliant. He was able to send by
foot, and passed the test because he wanted the ticket.

I expected - even hoped for - some >comments< on my posting. Let's have more.

Incidentally, about the no-code: It's an elegant solution; it should work.

73 and hny to all

I'

Tell us more about this "underwater telephone".  Is this for two subs in
the same area to talk to each other?  How did it work?

Correct. My point was that of all the folks I've talked to with desense
problems (which encompasses a wide variety of equipment configurations)
I haven't found anyone for whom the *Spectrum* filter did any good. Lots
of people have bought these things, only to throw them into their junkbox
the next day; if yours helps out with Mode J desense, then you're definitely
the exception.

I don't subscribe here, but I have questions that I hope a kind reader or two will be able to help answer for me.

1. I own a Hallicrafters SX-146 receiver, and I wonder:

   o From a practical perspective, does it do anything that, say, one of the new mini Sony receivers that costs one or two hundred dollars doesn't do? It has all kinds of switches and dials for sidebands and all, but I don't know whether they have been superseded in the new receivers or not.

   o Does it receive any frequencies that one of the new receivers don't? Does it receive weaker transmissions?

   o What kind of a resale value does it have? I have the manual and schematics, and as I haven't used the receiver for several years, and just moved into a very small apartment, I will probably want to sell it. Would it be appropriate to ask on rec.ham-radio.swap? (I won't unless somebody sends me email and says it's OK.)

2. I used to take an old tube AM radio and attach a long coil of wire to the tuning capacitor and get shortwave transmissions. I wonder:

   o Can modern radios of any kind do this? I tried it on a new GE AM radio and had no luck except for a CW-like transmission that might have been from any frequency including the top end of the AM spectrum.

o This, IMHO, is really neat! :-). (I got Canada and the USSR, I think, and other countries.). Have others discovered this? Could a similar trick be used to effect transmission?

3. I wonder about the the modern mini receivers:

o Do they have limiter circuits to prevent reception of particular frequencies?

o Do they use jumpers or more permanent methods of limiting frequencies that one can get? Is it a legal requirement?

4. I probably won't be getting one anytime soon, but if I do get a mini receiver (the Hallicrafters is too big for me, believe it or not), what type and/or brand do you recommend? I would want a small receiver that receives lots of frequencies.

It would be wonderful if you could reply by email.

Thanks!

Even though I opposed the no-code license, it seems very foolish to discourage the potential newcomers. Instead of driving them out, we should be doing all we can to ensure that the majority of the new hams are of the highest possible quality. No-code is here, it most surely is on 6 and 2, do what you can to get as many high quality newcomers as you can.

Since the FCC didn't buy my position that the new licensees should be located above 220 MHz (to supply a critical mass so that manufacturers would promote equipment for these bands), we're going to have to work much harder to retain our lightly-used microwave spectrum. (Yes, I know, they passed the same written test, they should have full VHF-and-up privileges.)

The assembled multitude might be interested in the following small display ad which appeared in the December 24 issue of "Broadcasting".

steven@ozonebbs.UUCP (Steven Rubin) writes:

+I want to put the antenna on my roof, but I am having trouble
+finding a good ground plane. The manager at Radio Shack suggest getting a
+peice of sheetmetal for a ground plane. How big should I make the sheet
+metal?

1. Yet Another Reason to Avoid Radio Shaft (YARTARS)
   This radio shlak person, like most, is talking through his hat. I can see the headlines now..._18-foot flying saucer lands on house_. I can not imagine buying, let alone installing, such a collossal piece of metal. Where does radio slock find these incredibly dense people?

2. a. The bad news: the ground plane should be at least a quarter-wavelength in radius, which, for 27 MHz, is about...(slip, slip, slip)...107 inches.

   b. The Good news: it doesn't have to be solid; in fact, you can get away with three or four pieces of wire instead.

Side view:

```
         |
         |    (center conductor of coax connects to this)
         |
         |
   ------+------ ground plane (braid of coax connects to this)
```

Top view:

```
         |
         |
         |
    -----+-----
         |
         |
         |
```

Sometimes people bend the ground plane radials downward, which raises the feedpoint impedance of the antenna from ~30 ohms to something closer to 50 ohms. This is desirable because the most if not all CBs are designed to operate with a 50 ohm antenna impedance. Note that the radials do not have to be stiff...they can be pieces of wire tied down at both ends. They should be connected electrically in any case.

Base station antennas of this sort usually have a full-length quarter-wave vertical element, as opposed to a physically shorter one with a coil. What type of antenna are you currently using? I'm guessing it's a mobile antenna with a loading coil of some sort. If that is the case, you might be better off just buying a regular base station antenna as long as you are going to this much trouble, since the full-length antenna will perform somewhat better (how much better? well, maybe 36.438764356 percent).

Wow, it's a good thing I don't read rec.ham-radio, since there will most assuredly be 6.02E23 other replies all saying this same thing, or pointing out that a full-length antenna will really perform 36.438764357% better, or asking if the resulting antenna would be FCC type-accepted or would it be against the rules part 95.7863(a) paragraph 3 section t etc. etc. etc. :-)

Good luck!

~!paul

steven@ozonebbs.UUCP (Steven Rubin) writes:

>I am setting up a CB in my house, and I am having problems with a ground
>plane.

I had very good luck with a quarter wave (104") mobile whip mounted on the roof of my house (secured to a short mast), with three (four would have been better still) quarter wave (104") ground radials (#14 wire or thicker) sloping down at about 30 degrees below horizontal.

The radials should be electrically connected to the "ground" connection at the base of the antenna, and the far ends should not be touching or near to anything conductive. I used nylon ropes to hold the radials in place, and the radials/ropes became guys to support the structure as well! #14 or heavier wire is best for the radials.

The antenna performed nicely with an SWR of 1.1:1 on all 47 channels.
(40 if you prefer not to count varactor magic) :->

Another friend did something similar with a center-loaded whip. The results were acceptable, but not as good as I got with the long whip (not surprising).

Now, I was just imitating other working designs, without any really good understanding of antenna theory, so there are undoubtedly things I could have done better. Please do post, so we can all learn.

[Note: I left the crossposting since this seems to apply to all the groups.]

Ever wonder why after all the billions of dollars and countless man-hours spent on searching for extra-terrestrial RF signals that we've come up with NOTHING ! ? I don't have the answer either. However, one possiblitity is that if there are technically advanced societies out there who at one time used RF to communicate, for one reason or other they stopped. Perhaps they realized RF is a potential health hazard and power levels by law are either kept to a bare minimal or/and everything goes over cable (fiber optic or whatever other medium). Will a distant planet perceive of a "Voyager" spacecraft as an "Enemy Intruder" if it is mapping the planets surface from above by means "radar mapping" ? Perhaps they have reached the mental ability to communicate via telepathy. Perhaps they stopped transmitting a million years ago and they were only transmitting for a span of 500 years. If this was the case, we would have lost their "window" of time in our mear 50 or so years of listening. Perhaps we are the only one's around or the only planet using RF ? Perhaps they destroyed themselves in a CW vs. Phone ops war.
I'd be interested in hearing some of the Net Reader comments re: RF and Sci-Fi/Sci-Fact.

Hi again! Happy newt ears, everybody!

I have a few questions, after some sleepless nights trying to read the entire ARRL Handbook...

1. Is it legal to communicate via repeater in a band for which you are not licensed? The specific example that I suspect will become a common question is 2m->10m repeaters. Previously, there was no class of Ham operator that was licensed for 2m but not 10m... but the codeless tech cannot operate 10m. Can she operate 10m via the aforementioned repeater?

2. Can I sign up to take the Tech class _with_ code, fail the code, and get a no-code tech license? This is a very enticing (win-win) scenario for me, and would probably be an attractive option for a lot of the people lured in by the promise of no-code (e.g., those that like a challenge but don't like to _fail_ :-).

3. I'm confused about whether a repeater and/or phone patch can be run without local direct control operator supervision. Are all those repeaters out there really babysat all the time they're in use? What about digipeaters and other packet radio stations?

4. Is it legal to make a repeater that changes its output frequency via DTMF signals (and appropriate security codes a la phone patch)?

5. Anybody know of dialup BBS's about Ham Radio in the Boston Area? I downloaded a list of Ham BBS's from SIMTEL-20, but both the ones in Boston were no longer in operation at the listed numbers. If not, (or if so), I could start one within a couple of months.

6. Would a 100W 10m Transmitter to an antenna, say, 100 feet away, damage one of those full-coverage scanners? Would a 1KW Transmitter? 2m? It just seems like that would generate a lot of energy at the antenna of the scanner-- how much is too much?

Advancing you great thanks for your kind responses,

-Eric

For sale:

*** Shure Microphone model 444D; purchased 2/14/90; $45.00

*** Hustler 4-BTV Multiband Vertical; purchased 8/22/90; $70.00

Both are complete with boxes, manuals, receipts. The 4-BTV was installed on a tower for 3 weeks, and is in excellent shape. The Shure has barely been used.

In one of my more idle moments, I thought of a fun thing to try that could be useful to other folks out there that needs a decent RF ground at the spur of the moment, and have a spare ANTENNA TUNER (no kidding) handy.

It turns out that most antenna tuners out there would work as a ready made Artificial Ground (AG). An AG is a series LC tuned circuit that has an RF current probe. A long ground wire is passed through the series LC in the AG before it is connected to your rig's chassis, so that the ground wire's reactance can be tuned out. You tune for maximum RF current.

Well, if you look at the schematics of your antenna tuner, you may find that there is a combination of an L and a C in series between a connector and ground! My AEA AT-300 did (this became a spare tuner when I got a Ten-Tec 238 tuner that did a better job, with it's roller inductor, for my antenna experiments. The AEA is sort of OK, but...).

I connected the ground (20' to a cold water pipe) to the center conductor of the "Transmitter" connector and strap the chassis of the AEA tuner to my rig's chassis. That is all there is to it. The power meter on AEA senses just the right current and all.

If you think about it, almost any topology commonly used in antenna tuners with have an L and a C in series between a connector and ground. A two-C-one-L pi network does, a two-C-one-L T network does and, like the AEA unit, a two-L-one-C T network does.

Not the cheapest Artificial Ground but it may be the easiest way for a lazy (I am the first to admit I am one) person to experiment with artificial counterpoises.

73 and have a fun '91, folks,

THIS IS A TECHNICAL QUESTION
ABOUT CAPACITORS, RESONANT
FREQUENCIES AND IMPEDANCE

Equipment concerned: ICOM R7000, NRD 525

What I am doing:

I am connecting the 10.7 Mhz IF output from my ICOM R-7000 receiver to my NRD 525 HF receiver. This is done so I can use the better filtering and additional modes of the NRD on the VHF/UHF frequencies. Because the 10.7 Mhz signal is carried on top of 9 V DC, I am using a capacitor in series with the cable. I do not know the impedance of the 10.7 Mhz IF output on the R7000 (ICOM does not either) but the antenna input on the NRD is 50 Ohms.
The setup functions (I hear stuff) with a .001 uF capacitor but I would like to have a better match:

- Have the circuit wire-capacitor resonant at 10.7 Mhz to get the maximum current through and also act as a filter.
- Have the impedance matched at 50 Ohms.

In addition, I am also connecting the Audio output of the R7000 to the 50 Ohms input of the NRD to tune to SCA that are at 67 Khz and 92 Khz. A capacitor in series would block any unwanted DC and also act as a filter.

- Have the circuit wire-capacitor resonant at 67 Khz to get the maximum current through and also act as a filter. Same for 92 Khz.
- Have the impedance matched at 50 Ohms.

Questions:

1- What is the formula that gives the resonant frequency of a capacitor? The formula giving the resonant frequency of a circuit, f=1/(2*PI*SQR(L*C)) lets me wonder what value I should take for L Should it be the impedance of the coax (50 Ohms). The ARRL Handbook has a table of resonant frequencies for capacitors and specifies the length of the leads, but that table does not have anything for 10.7 Mhz or 67 Khz or 92 Khz.

2- To try to match impedance to 50 Ohms I am using the formula Xc=1/(2*PI*F*C) with Xc of 50 Ohms. This gives me a capacitor of ~ 300 pF for 10.7 Mhz (With a 52 Ohm coax it should really be 286 pF). Is this approach correct or am I totally mixing up Apples and Oranges ?

3- Because I am building 3 cables (10.7 Mhz, 67 Khz, 92 Khz) and because I want only those frequencies, I would like to have a high Q on the capacitor acting as a filter. Is this possible to achieve ? Note that these cables are used for reception only, therefore I do not have to worry about power.

4- How can I match the Audio output of the R7000 (I think it is 150 Ohms) to the 50 Ohms antenna input of the NRD 525 ?

I am more interested in the technical answers that someone stating "I use a xxx uF capacitor and it works fine for me". I want to know how to make it better.

Please reply to the net, as it may interest others.
Thanks.

>NOTHING ! ?

Actually, there's a simple explanation for having heard nothing: so
far we've only listened to a tiny fraction of the search space
(duration, frequency, spatial direction) with enough sensitivity to
detect other earth-like civilizations. We have a lot more listening to
do before we can conclude there are no other earth-like civilizations
within X light-years. There are some major projects gearing up to do just
that. They're considerably cheaper than a "billion dollars", however;
a real bargain by NASA manned space flight project standards.

Phil

Given a "Rabbit"-type TV transmitter and receiver operating around 900 mhz, what
is a better & more directional antenna than the 3.5" vertical coming out of the
boxes? Thanks much.

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

Line 2

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
10-11	International Designator (Last two digits of launch year)
12-14	International Designator (Launch number of the year)
15-17	International Designator (Piece of launch)
19-20	Epoch Year (Last two digits of year)
21-32	Epoch (Julian Day and fractional portion of the day)
34-43	First Time Derivative of the Mean Motion or Ballistic Coefficient (Depending on ephemeris type)
45-52	Second Time Derivative of Mean Motion (decimal point assumed; blank if N/A)
54-61	BSTAR drag term if GP4 general perturbation theory was used. Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63	Ephemeris type
65-68	Element number
69-69	Check Sum (Modulo 10) (Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)

Line 3

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
09-16	Inclination [Degrees]
18-25	Right Ascension of the Ascending Node [Degrees]
27-33	Eccentricity (decimal point assumed)
35-42	Argument of Perigee [Degrees]
44-51	Mean Anomaly [Degrees]
53-63	Mean Motion [Revs per day]
64-68	Revolution number at epoch [Revs]
69-69	Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

```
NOAA 6
1 11416U          86 50.28438588 0.00000140           67960-4 0  5293
2 11416  98.5105  69.3305 0012788  63.2828 296.9658 14.24899292346978
```

Note that the International Designator fields are usually blank, as issued in the NASA Prediction Bulletins.

A reasonable view.

>2. A dramatic increase in amateurs on the UHF and Microwave bands,

>loading problems, only more so. The ARRL felt (whether you agree with
>it or not) that a 220-and-up license would force new hams to break new
>ground on the upper bands.

A dramatic increase in activity on UHF+ must await a critical mass of users. These users should be socialized to amateur radio operations rather than being left to invent a new service on their own. Thus "ghettoizing" the newcomer is not a good way to achieve critical mass. By mixing the newcomers with the old timers at the "watering hole" on two meters at first, the end result will be a gradual migration of *one* culture to the higher bands.

>3. Acceptance and assimilation of these new hams into the mainstream

>of the hobby. Again, bitter divisiveness, shunning, old Tech's using
>a /C suffix, and other childish games will not make these new hams feel
>welcome. If this new license, as sensible and well though out as it may be,
>causes more divisiveness and infighting (possibly played out on the ham
>bands), then it may hurt more than help amateur radio.

This type of "one upsmanship" attitude of "I'm better than you" is already prevalent on the ham bands and has been since at least 1968. The General looks down on the Tech (he's not a real ham because he can't work 20 meters). The Advanced looks down on the General and the Extra lords it over them all. Removing the Morse requirement from a class that rarely uses it anyway should not make the caste system much worse.

>As was stated previously, the stream of comments coming in to League
>officials on the issue have been split 50/50. If you write the ARRL, and I
>encourage you to do so, please consider the following in your letter:
>
>1. Will 6m TVI be a problem? Why/Why not?

No. Reasons. Six is not presently a very popular band. There is little commercial equipment available for Six. Our ranks are not likely to soon explode with Six meter DXers. Our new techs are likely to follow the herd and emulate current tech operating habits, at least until they gain some experience. Since the only difference between current Techs and the new Techs is 5 wpm Morse, and knowledge of Morse doesn't help one solve TVI problems, the new Techs should cause no more problems than the current Techs do. Cable TV.

>2. Will 2m band loading be a problem? Why/Why not?

No. First of all, 2 meters is not overloaded now with anything but mostly silent repeaters. Operating patterns may have to change somewhat. The luxury of one repeater for every two amateurs may have to give way. And some users may wish to permanently migrate to UHF in an attempt to maintain that ratio. But, the band is in no danger of congestive collapse.

>3. What recruitment efforts do you and/or your club have in place to
>test, train, and accept these new hams?

The club(s) that I belong to intend to welcome these people with open arms. Many members are already sounding out likely prospects and our clubs intend to modify our present training classes to include the codeless technicians. We hope to boost our middle school program with the codeless tech option.

>4. What kind of impact will this new license have on use of the UHF
>and Microwave bands?

I expect the impact to be modest at first. We need to build a critical mass of socialized users before interesting services will develop on the upper bands. A combination of the experimental interests of the new licensees and increasing pressure on traditional hams operating primarily at 2 meters will slowly build the critical mass to make the higher bands take off.

>5. Will the new license cause a splitting of hams into code/no-code
>camps? What can you and/or your club do to make these hams feel
>welcome and smooth over ruffled feathers among existing hams?

There are bound to be some traditional hams who will resent the newcomers, much the same way they resent current newcomers. Trying to be inclusive rather than exclusive should reduce the fragmentation that plagued amateur radio in the post '68 decline of the service brought on by Incentive Licensing. At least in the clubs I frequent, I find a large number of active amateurs who are excited about the prospects of new technologies and who welcome *anyone* who shares their interests. Naturally I don't frequent those mortibund clubs that spend all their time arguing about increasing the CW IDer's speed on their tube type repeater, or who endlessly haggle about Robert's Rules of Order. One of my favorite groups specifically eschews Robert in our charter, and we don't charge dues. We find that passing the hat when we need to do something works very well. We don't have a President either, preferring a Lord of Chaos as our leader.

The Beverage is primarily used as a receiving antenna. It suffers heavy ground losses as a transmit antenna and requires large non-inductive resistors for it's termination if used in transmit service. Many 160 meter operators use a vertical for transmiting and multiple Beverages for receiving.

>The all time best AM broadcast band DX antenna would be an active loop
>antenna located some distance from the house, electrical wires, etc.
>The loop would of course be remotely rotatable. The gain of this setup
>would be such that the baseline atmospheric noise it picked up on the
>quietest night would just override the receiver's internal noise. The
>long antenna you propose would tend to cause a receiver dynamic range
>problem without any real DX benefit.

The major advantage of the Beverage over the loop is that the Beverage has a very narrow angle of acceptance while the loop receives over a nearly 360 azimuth with a narrow, but very sharp, bidirectional null. The Beverage, on the other hand, is truely unidirectional with a major lobe of about 15 degrees for an eight wavelength model. This means that it strongly rejects signals and atmospheric noise from nearly 345 degrees of the compass. This results in a very quiet antenna that can separate two stations operating on the same frequency if they are more than 15 degrees apart at your location. This is very useful for Broadcast Band DX.

The major disadvantage of the Beverage is physical size. You really need access to 300+ acres of property to properly install a system with one Beverage wire every 15 degrees. If your house is back in the woods, this is not generally a problem except at timber harvesting time.

I have no idea what they were, but you can be assured that any real HT you find won't work like those did. The scriptwriter obviously didn't have the slightest idea how a personal communication device works in the real world.

The HTs were pretty obviously half-duplex devices (they had a PTT switch), and yet people were able to break in while someone else was transmitting. Other people could "hang-up" on you (huh?). And his call to police dispatch was a little outrageous.

I know you knew all that. :) The devices they used in the movie may have been built by the prop department.

Has anyone had experience with the automatic antenna tuner(s) for the Kenwood TS-440? I have a Butternut HF6V and would like to hear if anyone has had good or bad experience with either the AT440 built in automatic tuner or the AT250 external tuner with this or other verticals.

We are indeed proud of our relationship with AMSAT-I in general but with Alberto Zagni, I2KBD, and his crew in Milano. They have taken Microsat schematics, mechanical drawing, and without much help, have constructed an operational Microsat. So proud are we of them, that we have made his group operators on PACSAT, the microsat run by AMSAT-NA. A truly fine new satellite building group is being formed in Milano and I am extremely proud of them.

>

Good riddance. This was a ripoff (err uhh I meant `copy') of UOSAT-2. They insisted on operating the thing in the low end of 2 meters (in the 2 meter EME band) and would never tell anyone anything. This had very very litte to do with amateur radio. It was a terrible misuse of amateur radio frequencies. I happy the Pakistani's successfully launched their first satellite but I am deeply distressed that it went into service in the amateur radio bands and did not operate in the amateur satellite service.

> John A. Magliacane

Thanks John for publishing this news. It is a nice service.

I have a TS-790A and I use it only as an IF for my S band gear. I took it

out of satellite service within one week of putting it on the air and
went back to using my IC-271 and IC-471. Satellite operation was
strictly an add on option at the last minute and without input from
a satellite user is what I fear happened. After DOVE gets reloaded,
I am going to do something else about a 2 meter IF for DOVE since the
thing is not suitable in any way for data. I hope some day the JA
rig companies will realize that 50000 plus tnc owners (at least) need
support as well.

Even dumber now Jim.  Please see the latest ARRL bulletins.  The FCC gave
them no time to react.  It is a fait accompli.  The commission ordered
it into effect on February 14.  No appeals allowed.  If the ARRL wants
to waste money on another lawsuit, possibly they can do something.  It
is really time to put this decision into our pipe and smoke it.  It can be
a success or failure or simply a ripple into amateur radio's not so
long decent into senility.  We have been given a recruiting tool.  I
suggest that we go out and make use of it.  If you do not like the nocode
tech, then recruit your people from those to whom learning the code is
not a deterrent into getting into amateur radio.  It seems that Jim and
I (and many others) have found potentially valuable recruits for whom the
morse code requirement was sufficiently daunting to force refusal of
amateur radio as a hobby.  We must make amateur radio relevant to the
21-st century US citizens now, or there will not be such a hobby then.
(I only talk about relevance to US citizens since this is an FCC action
and not a UN one ;-).

>   but don't like to _fail_ :-).

I don't see a reason why not. When I took my tests the first time,
I asked to take the whole sheebang, but I flunked 1c (20 wpm) after
passing the written exams. The grand OM giving the code tests simply
kept me seated and played the 1b (13 wpm) tape to me. They then
submitted the Form 610 for an advanced license.

I am sure they will do the same come February for those who passes
Elements 2 and 3a, tries 1a but flunks it.

For those of you edgy and nervous about the tests, don't be. The
Volunteer Examiners couldn't be a friendlier bunch of folks who
wants to find every legitimate reason to *pass* you. After
flunking the 20 wpm 10-questions test, the examiner plowed over
and over through my illegible handwriting to try hard as heck to
see if I had 1-minute solid-copy. At least, that was my experience
with the ARRL VEC in Cupertino here. Absolutely super people.
(See? I don't *always* bash the League. :-)

So did I, remember? That still doesn't justify the disgusting jokes about
druggies and being dropped on the head.

> The real answer is: It's true that -maybe- some handicapped persons
> can't pass
> the code test because of some physical failing.

Maybe? What about dyslexics who can't tell the difference between dots and
dashes no matter how they are transmitted - sound, light, vibrations, etc.

> And the whole thing started because Pres. Bush got a bug up his ass and
> sent
> a memo to FCC.

Bush got bugged because it took a Arab king to make him aware of the
insensitivity of his own administration.

> What credentials does the average MD or DO have for deciding whether you
> or I
> can't pass the CW test "because of ***"?

Depends on how well they have the problem explained to them, I guess. If you
tell a neurologist you're having trouble telling the difference between short
tones and long tones, he'd probably be able to handle that. If you tell him
you can't tell the difference between .-.. and ..-. he'd understand that.

>   I will repeat: it's a farce. Is your muscular distrophy
> limiting you
> more than Frank Spicer's blindness/deafness? Or maybe K3KTH. I haven't

Ding bust it, we're not talking about sensory or motor handicaps. We're
talking about neurological handicaps that make PERCEPTION and INTERPRETATION
of sensory input difficult or impossible.

> Incidentally, about the no-code: It's an elegant solution; it should
> work.

Well, there I agree with you. Elegant is the word.

Excuses for posting: I have a feeling there are a lot of hams-to-be reading
rec-ham.radio these days; I'm not flaming; There's a question at the end
of this reply.

In a recent article chguest@pioneer.arc.nasa.gov (Charles J. Guest) writes:
>A) I have been away from the ham side of things for so long that I am
>even in a quandry as to what to look for as far as books on the subject.
>I suspect that ARRL still puts out quite a library, but I am more
>interested in something to help get the license that is less stilted in
>the ways (and pockets) of the ARRL.
>...

Radio Shack sells Novice, Technician, and General class study guides.
(They also actually still sell a Ham radio! Boy was I suprised
about that! [10m mobile-- you can't operate it as a no-code tech :-( ]).
They list for $19.95, $4.95, and $19.95, respectively (the higher
priced ones come with code cassettes). The ARRL book "Tune in the World"
book alone is $14, $19 with code cassettes. The Tech manual is
$6. For my money, I'd rather support a group of friendly technically
oriented people than rude idiot salemen. If you really want to save
money, sign the ARRL books out of your local library (but get the most
recent ones you can find-- I've found some pretty out-of-date info!).
Note: I was suprised that the ARRL Handbook doesn't contain any study
guides (but just about everything else). That's the book most likely
for your library to have.

>C) One of the big draws, asside from helping others, to the ham hobby
>was the ability to talk across the country and overseas. Since this is
>not going to be possible for me on the HF bands, have there been any
>developments in the last ten years that could be of interest to me in
>this regard?

I'm told that there are networks of 2m->10m repeaters that will let
you DX from a Handheld (albeit a limited choice of frequencies). If
this is incorrect, I'm sure someone will chime in. A lot of the

```
activity in Ham radio of late seems to be aimed at reducing the
amount of equipment you need to be a well-connected Ham (for instance,
I believe there are various gateways coming online between different
types of packet radio).

>D) Keeping a budget in mind, if you had to start all over again buying
>new equipment for your shack what would you consider buying.

I don't own much equipment yet (I'm not licensed either), but I will
probably look for it at Ham Swapfests.  I think they are listed in
QST (a good reason for joining the AARL).  Ham equipment is pretty
inexpensive used (unfortunately, the best price/performance bargain
is all old 10m equipment-- I've a few offers for _free_ stuff like
that, which is one reason I'm tempted to go for the coded tech license).
A problem for me is knowing what a Whizbang TQ-500 All band _is_!
Another good reason to get QST...

Along these lines, are there any used-ham-equipment catalog publications?

Cheers!

ARRL/VEC NEWS RELEASE   December 14, 1990

To: All ARRL VE Team Liaisons

From: Bart J. Jahnke. KB9NM. ARRL/VEC Manager

FOR IMMEDIATE RELEASE

FCC CREATES CODELESS CLASS OF AMATEUR RADIO LICENSE

For the first time ever, starting in February it will be possible to obtain an Amateur Radio license in the United States without passing a Morse code test. This was announced by the FCC at its open meeting yesterday, December 13th. The Federal Communications Commissions (FCC) has eliminated the need for new Technician class Amateur Radio license applicants to demonstrate proficiency in Morse code in order to have all amateur privileges above 30 MHz. The implementation date may be as early as February 1991. Technicians who obtain their licenses prior to that date will be grandfathered, meaning their existing HF privileges will continue.

The codeless Technician written examination will have 55 questions (existing Elements 2 and 3A). New Technicians wishing to gain access to the HF privileges below 30 MHz will be required to pass the Element 1A (5 WPM) Morse code test before three Volunteer Examiners accredited by Volunteer Examiner Coordinators, and will be given a Certificate of Successful Completion of Examination (CSCE) to serve as evidence of their qualifications. That CSCE must be retained by them in perpetuity to prove they have met the requirement to gain access to the Novice HF bands. Novices wishing to upgrade to Technician must pass Element 3A to gain the VHF privileges of the Technician class. Novices will need to retain a copy (preferably the original) of their Novice license in order to show that they have met the 5 WPM requirment for HF band access. This is because there will be no call sign designator to indicate Technicians who have or have not passed a code test. VECs will supply the FCC with a list of those codeless Technicians who passed element 1A.

There has been no change to the Novice license in any way, nor has there been any change made above the Technician class. Novice examinations will continue to be available both by two Novice examiners (no test fee), or by three accredited VEs (no test fee if only elements 1A and 2 are involved). The FCC decided to retain the current Novice Class operator license as an alternate entry level license for those persons able to pass the 5 WPM Morse code test instead of the more comprehensive written exam required for the Technician Class license.

At a press briefing held just after the Commission's meeting, FCC Private Radio Bureau Chief Ralph Haller said "The Amateur Service is not growing as it should relative to what it has to offer." He said that the Amateur Service is where our nation's technical expertise comes from--that the changes should attract people who are interested in computers and digital communications, and should help the US to become more competitive.

In a news release today, ARRL President Larry Price, W4RA noted with pleasure that the Commission had decided to retain the Novice license as a means of entry into Amateur Radio and to adopt a codeless license with a meaningful written examination requirement. "Our members were very strong on both of these points, because they couldn't imagine how we could maintain the character of the Amateuer Radio Service without them," Mr. Price said.

Presiden Price sounded a note of caution with the privileges the Commission plans to grant codeless licesees. He indicated that the formula developed by the ARRL Board, which called for privileges above 220 MHz, was based upon extensive membership input. It was carefully balanced to offer attractive privileges while protecting existing patterns of amateur activity. While it will take some time to gauge the reaction to the Commission's action, Mr. Price observed that the FCC formula is likely to be less acceptable to many amateurs than the League's. He asks that League members share their views with their elected Directors, who will collectivly determine League policy.

"Before we can decide whether to request that the Commisson partially reconsider its action, we'll have to see the Report and Order," said Mr. Price. Usually it takes the FCC from several days to several weeks after a Commisson action to release an itemn after editorial review. There is a 30 day window of opportunity following release in which petitions for recondsideration can be filed. Mr. Price noted that ARRL Board was holding its regular meeting on January 18-19 1991. "The timing looks good for a careful review of the Commission's action at that meeting," he said.

```

Your response seems to me to be more of a flame that his was to you.

It also seems a bit of overreaction.

Hams have always had a tradition of helping others learn. I am indebted to
countless Elmers.

It could be that he was trying to help. "Help" does not need to be restricted
to technical items.

Perhaps some people only accept help when they ask for it and reject it
otherwise.

>this is incorrect, I'm sure someone will chime in.

I got real curious about this, since I got mixed replies.  So I called
the ARRL, and Tom Hogerty, KC1J, kindly informed me that the general
rule is that you _may_ operate a repeater that outputs on frequencies
for which you are not licensed (he mentioned something I did not fully
understand about not being allowed to _change_ the repeater output to
a band for which you aren't licensed, which makes sense, but specifically
said that if the repeater is already set up, it's OK).  So this is
a valid and legal way for the new no-code techs to get a taste of DX!

Cheers!

All you need is four horizontal pieces of wire, going out in different directions, each of them as long as the antenna itself. This is a very common configuration for commercial 2-way radio antennas.

The League stuff still gives you the broadest *understanding* of the topics you need to know. There are several Q&A books out there that you can find at many ham stores. They are sufficient to pass the exam. But don't shortchange yourself, get a general reference and absorb some material. It will prove useful later on.

She may work in tandem with you as long as you supervise all transmissions. This is considered third party operation and some restrictions apply, but none that should bother you at VHF+. She may not use amateur radio unsupervised in order to contact you. She may use *any* radio equipment in a true emergency where there is an immediate threat to life or property and no other means of communications is available. This is a rather rare occurrence intended mostly for shipboard disasters where there is absolutely no other way of signalling for help.

>for transmission and reception in that area as well as anything else.

Well there are satellites and there are satellites. Some satellites support SSB voice and *ahem* CW communications. The rest are for use by packet radio. A from scratch SSB satellite station will realistically cost well over $1000, more like $2000 if purchased new. A satellite capable packet station can be cheaper in the RF department, but you must add in the computer and TNC. So you're still looking at a couple of grand for a from scratch setup. On the other hand, if you already have a HF radio, you can put together a satellite CW station for about $200 and a little scrounging. Of course, if you could do CW, you could just use the HF rig.

>D) Keeping a budget in mind, if you had to start all over again buying

A first cabin Tech station would have an Icom 970 equipped for all mode

2 meter,70 cm,and 33 cm and 100 watt amplifiers for each band. Add in a set of circularly polarized yagis on an AZ-EL mount and you would be equipped to do all the popular modes including satellite. A budget operation that gives FM only capability would be an Alinco 570T. This would give you medium power on both 2 meter and 70 cm FM. My personal favorite handheld is the popular Yaesu FT470 dual bander. For the real cost cutters, I'd find a used Icom 2AT at a hamfest for two meter handheld, and would look for any of the medium power used 2 meter rigs such as the IC28H for my base or mobile installation. In general a mobile rig run off of a separate power supply is a very good choice for home use. Most AC operated VHF/UHF equipment will be all mode and much more expensive.

I have used the TS-440 with the built-in automatic tuner for over a year now. I use a Cushcraft R5 vertical for 10 thru 20 meters and a simple balun fed dipole for 40 meters. I can drive the R5 barefoot (i.e. tuner out) for all bands except the upper part of 20 meters. Above 14.150 the SWR rises above 1.5:1 and I cut in the tuner. It works great.

I run the tuner on the dipole on some frequencies in the 40 meter band if the SWR gets above 1.5:1. On occasion I felt the need to make a contact on 80 meters and have loaded the TS-440 into the 40 meter dipole using the tuner. It flattens out the SWR at the TS-440 but who knows what is going on at the balun (lost my Smith chart). I don't run it long on 80 meters into the 40 meter dipole since I am concerned about exceeding some volts or amps up the line.

I had one problem with a previous 40 over 20 balun fed dipole pair. The autotuner would not settle to a null on 20 meters although the

indicated SWR on the TS-440 meter dipped below 1.5:1. I solved
that by getting the R5.

All-in-all I am really pleased with the combination of the TS-440,
auto-tuner and the Cushcraft R5.

Yes. The repeater transmits under its license and you transmit under your
license. As long as you transmit on frequencies for which you are authorized,
the repeater can retransmit your signals on any frequency *it* is authorized
to transmit on.

Yes. It's good practice to attempt *lots* of exam elements, and then take
the highest class license for which you have passed all the elements.

I assume this is an unlicensed device operating under FCC Part 15.
Increasing the power output (even if only by improving the antenna)
is probably not legal. But if you want to proceed, standard antenna
theory works at 900 MHz... you could build a baby Yagi or cubical quad.

Goodbye. Philips is having layoffs, and they did it at my site. Only reason that I haven't got told officially yet is that I'm out sick on disability (eye trouble). But several reliable sources tell me that I'm to be canned when I return to work (Jan 2). My normal remote dial-up computer access code no longer works, I'm using a friend's code, at his house. Don't think they can tell whose.

The kind of work I did is television R&D, including HDTV (high defination TV, regular NTSC television, developing patents (I have 11) in this field. Also have done DSP, & high speed digital logic design, up to 114MHz clock speeds. I posted my resume on misc.jobs.resumes Or call me up and I'll mail anyone interested a copy of it, and a list of my patents. Will consider anywhere in USA. Corporations, and colleges (someone at a college called me about 2 weeks ago, call again).
Also give my name and number to any and all headhunters.

```
Robert Casey            Amateur radio WA2ISE
855 Oradell Ave         Amateur radio packet:  WA2ISE@KD6TH
Oradell, NJ 07649
201-261-4066
```

Don't try to use e-mail, as Philips is going to delete my computer account the day I get officially canned. I don't expect to be able to log on again.

This is the dark side of American life. But getting layed off is better than getting killed in or near Tianamen Square.

As quoted from <1759@ke4zv.UUCP> by gary@ke4zv.UUCP (Gary Coffman):
+---------------
| and who welcome *anyone* who shares their interests. Naturally I don't
| frequent those mortibund clubs that spend all their time arguing about
| increasing the CW IDer's speed on their tube type repeater, or who endlessly

| haggle about Robert's Rules of Order. One of my favorite groups specifically
| eschews Robert in our charter, and we don't charge dues. We find that passing
| the hat when we need to do something works very well. We don't have a
| President either, preferring a Lord of Chaos as our leader.
+---------------

Unfortunately, I belong to one of those moribund clubs --- there being few alternatives. Fortunately, however, there is a growing split in the club and I suspect no-code will cause it to come to fruition --- those many of us who want to embrace the future will likely end up splitting off and forming our own club, leaving the "Retirees on Radio" (my name for the current mess) to go to hell in their own handbasket. (But many of those who are growing increasingly dissatisfied are club officers, so it may happen the other way around. I can hope.)

Personally, I strongly support the new Tech license, *in conjunction with a greatly improved PR drive* (see my other thread). I'd like to encourage potential hams to join our little (for the moment) packet group --- we are small, but already we're working with a number of high-speed packet networks and are likely to become the Ohio gateway into NEDA soon. We have plenty of room over here on our two 2m frequencies, and we are working on other frequencies. WB8LYJ intends to set up a 902-928 local LAN, and I will start out on 220 and then move the high-speed LAN link to microwave and set up a Novice user port. If I can get the microwave gear sooner, I may skip the 220 high-speed link and just set up the user port --- the only 220 activity locally is a backup Ohio LAN link shared with PacketClusters and a BBS forwarding frequency that is less than welcoming to Novices.

In any case, *I* will be working to bring new hams in --- with or without the local club's help or approval. (If it's without, I may look over some of the less local clubs.)

As quoted from <53@bootsie.UUCP> by olson@bootsie.UUCP (Eric Olson):
+---------------
| 1. Is it legal to communicate via repeater in a band for which you are
| not licensed? The specific example that I suspect will become a common
| question is 2m->10m repeaters. Previously, there was no class of Ham
| operator that was licensed for 2m but not 10m... but the codeless tech
| cannot operate 10m. Can she operate 10m via the aforementioned repeater?
+---------------

I assure you there was and is: both Novice and Technician can not transmit on the section of 10m used for repeater operation. FM, being wideband (compared to SSB), is restricted to the upper part of 10m to which Novices and current Techs don't have access.

I had the same question when I got my Novice license, because I wanted to pick up a 220 HT and wanted to know if it would be legal for me to use the local linked repeater. The answer was a definite YES --- because it's not you controlling the transmission on 10m (or 2m in my case), it's the repeater control operator. The general rule is that only a ham licensed for the transmitter output frequency may make or break the link, but once it's made any ham licensed for the *input* frequency may use it. This is especially important when you consider that the outputs for virtually all 220 repeaters are outside Novice privileges... but virtually all *inputs* are within it.

+---------------
| 2. Can I sign up to take the Tech class _with_ code, fail the code, and get
| a no-code tech license? This is a very enticing (win-win) scenario for me,
+---------------

Passing an exam element gets one a CSCE (Certificate of Successful Completion of Examination). Submission of the proper unexpired CSCE's along with a Form 610 gets one a license. Since Tech now requires only elements 2 and 3A, if you fail Element 1A but pass 2 and 3A, you will still be eligible for Tech. If you pass 1A and 2 but fail 3A, you will be eligible for a Novice ticket. If you pass all three, you will be eligible for Technician with the code endorsement and corresponding HF privileges.

I currently have an outstanding CSCE myself (Element 3B, General theory) awaiting my getting enough time away from work to work on the Element 1B code and hopefully Advanced theory. The CSCE is good for one year from the date of issuance (except that Element 1A is now good forever if you've passed element 3A); you have one year to pass the remaining element and upgrade.

+---------------
| 3. I'm confused about whether a repeater and/or phone patch can be run
| without local direct control operator supervision. Are all those
| repeaters out there really babysat all the time they're in use?
| What about digipeaters and other packet radio stations?

+---------------

The FCC RULE BOOK put out by the ARRL states very clearly that Novices may not initiate or terminate autopatches because they in effect would become control operator of the repeater. However, a Tech or higher may initiate an autopatch, and the Novice may then use it. This is basically the same as the rule for linked repeaters.

Automatic control is restricted to certain frequency ranges; repeaters (including digipeaters) are therefore restricted in the frequencies they may use. The frequency ranges do *not* include most of HF (excepting the section where FM repeaters are permitted; a rather limited range of frequencies, but it must be remembered that the *entire* HF range, amateur and otherwise, would fit inside the 420-450 MHz ham band!).

```
+---------------
| 4.  Is it legal to make a repeater that changes its output frequency
|     via DTMF signals (and appropriate security codes a la phone patch)?
+---------------
```

Absolutely. It's called a "remote base". Various repeaters in my area have remote bases on 10m, 6m, and 2m --- at least. There are probably others; I believe I read something about a local repeater with a 220MHz remote base.

Well, I should qualify that. A repeater must (or at least should) have a fixed input and output separated by the standard offset for the band in question (i.e. 100 KHz for 6m, 600 KHz for 2m, 1.6 MHz for 220 MHz, 5 MHz for 440 MHz, etc.; these are U.S. figures, they are different, for example, in Europe) and the frequencies should be assigned, or at least cleared with, the local frequency coordinators. However, such a repeater may have one or more remote bases on it, following the same rules as above (Novices can't control the remote link but can use it, etc.).

Phil is exactly right. There is another dimension that Phil didn't mention that I have always thought to be important: signal structure. The SETI guys look for extremely narrowband signals. Often they talk about 1 Hz wide bins in their spectrum analyzers. I've seen them talk about 0.01 Hz wide bins! They don't have much choice really. They need the integration time afforded by the narrow bandwidth to make the link budget work at many light-years distance. The Carl Sagan novel "Contact" has an alien civilization receive ordinary broadcast television signals radiated from Earth. The information bandwidth in such a signal means that the rcv antenna required at the alien planet few light-years away from earth would have to be bigger than a typical planet. Maybe possible, but not likely to be likely.

Information content is not the only thing that increases the bandwidth of an RF signal, of course. Here on Earth, advanced communications systems spread the bandwidth of signals for other reasons: to combat multipath, to share spectrum efficiently, to derive precise timing from a signal (as in navigation systems). These systems are known as "spread spectrum" techniques.

My personal theory for why the SETI researchers have not detected alien RF transmissions is that the aliens are a few years ahead of us, and therefore are all using spread spectrum.

Brandon,

Let me suggest an alternative. The favorite group that Gary mentioned is the one that he and I started about a year ago centered around our new 443.65 repeater here in atlanta (where the REAL hams hang out :-).
We had gotten fed up with the degraded condition of our old club, repeater and general conversation and decided to do something about it. So we started brainstorming and looked around at what had worked in other areas. One of the most successful enthusiast/professional groups in Atlanta is the Atlanta Unix Users' Group. There is no club, no officers and no structure. One person, Lindsay Cleveland, handles planning the programs and scheduling the room. Whenever he needs postage money or whatever, he announces it at the meeting and we all pass the hat. Conspicuously absent is the political bickering, the power plays, the cliques and all the other bad stuff traditionally associated with enthusiast associations.

We decided to take the same approach. I scrounged up a power supply and chassis, Gary scrounged some duplexers, KM4BA came up with radios suitable for conversion to repeater service, I fabricated the antenna mount, KI4XO came up with a network analyzer to tune the assembly with and a host of others contributed the other misc items. We passed the hat in order to buy the controller, crystals, antenna and misc hardware. Since I'm physically the largest of the group :-), I took charge of fundraising. We pulled off the whole process in a few months and are now looking toward remote receivers and/or linking with another repeater on the other side of town plus having a hot standby repeater on the ground. Decisions get hashed out on the air or over coffee at the local Waffle House.

We consider the system to be totally open. We'll give a copy of the repeater control codes to just about anyone who asks. But since there is no patch or bleeps, boops or squeeks on the repeater, there is little to control.

This system is working marvelously. We have a nice, well engineered repeater with a very collegial environment. Our biggest problem so far has been the weather which has made it rough finishing the tower work. Since there are no club meetings or officers, there is no opportunity for anyone to get mad or to play politics. If someone wants to make a change in something, we say fine! If we all like the idea, we'll help out. If not, well, try it and see what happens. if it's good, it stays otherwise we talk you out of it. On the other hand, if you get pissed off at the way things are, there is no organization to direct your anger at.

The nice thing about this non-organization is that when people are motivated, there are no impediments in their way. And when people get burned out as I did awhile back, others migrate in to fill the void. And when the burn- out is over, you can migrate back in again. This scheme is quite similiar to the Usenet and it works for the same reasons Usenet does. The other thing that this non-organization does is plainly recognize the fact that most things get done by a handful of people. There is no pretense of a non-producers being a part of the group because the group by definition consists at any moment of those that are actually doing something. Consider giving it a shot.

OK, all you vacuum-tube wizards. Here's a puzzler for you.
Well, it's a puzzler for me, anyway:

I want to build a couple of VHF power amplifiers using the 3CX800 triode. This is no problem, since there are several designs published. But I would like to run them all from a common HV power supply. Is it OK to just connect each amplifier's B+, B-, and chassis grounds together? Actually, the real question is what will happen to cathode-current metering? I gotta admit, triodes in grounded-grid baffle me. Any help out there?

Along a similar line, can you think of any way in the world to also run a grounded-cathode tetrode (ie 4CX250 or 4CX1000) from the same HV supply as the triodes, at the same time? I don't think it's possible, but I could be wrong. (where will the B- be, at chassis or floating?)

E-mail direct if you don't want to QRM the no-coders.

Mike

I think this is the reaction to the public support of the FCC decision and the widespread condemnation of their trial balloon about Reconsideration.

I long ago came to the conclusion that the only way to deal with the ARRL is to regard them as the publishers of a fairly decent magazine PERIOD. We'll have to our own lobbying with Congress and the FCC. Frankly, I think even the

Commission would prefer that. I suspect they regard the ARRL as the Antiquarian Rant 'n' Rave League.

>but the dot-dash pattern is printed right on the chart..

While cruising with your friend joyfully along at 70 MPH, having to search for
the identifiers on the map and carefully comparing each character against the
map notation (sometimes requiring several passes) is no biggie. It's a
different matter when you are alone, drilling a hole in the soup at 480 Knots.
At 8 miles per minute, you can be in timbuktoo before you find out which
station you've got. That's if everything is going smoothly. Throw in a small
problem with the machine, or a "last-minute" clearance change from ATC, and
you'd be thankful to be able to copy the ID in your head.

>12 years of flying didn't help much on my Novice code test :-)

Over 30 years of flying didn't improve my code speed either, but I certainly
was thankful that I already knew the characters when I did need them.

But wait. This isn't the forum to air this discussion. Please direct replies
to me rather than the net.

>   cannot operate 10m. Can she operate 10m via the aforementioned repeater?

Yes. There used to be a class of ham operator who didn't have 10 meter privledges, it was called, strangely enough, Technician. The more things change etc. Anyway, as long as the control operator for the repeater is licensed for the output frequency of the repeater and the user is licensed for the input frequency of the repeater, all is legal. Lots of 220 to 2 repeaters around serve to link Novice operators with the rest of us.

>2. Can I sign up to take the Tech class _with_ code, fail the code, and get

>   without local direct control operator supervision. Are all those
>   repeaters out there really babysat all the time they're in use?
>   What about digipeaters and other packet radio stations?

This is sticky. The rules say that all third party operations must have a control operator. The operator doesn't have to be physically present at the repeater site however. He may use wireline control from a remote point or he may use auxiliary link frequencies to maintain remote control. The sticky part is determining if he is there and doing his job. He needn't be able to talk to you over the repeater to be in control so he may be there or not without your knowledge. It's his license on the line for failure to control the system though, not yours. As for digipeaters, the FCC granted permission for their use under automatic control at VHF and above even when carrying third party traffic. And a regular voice repeater may operate under automatic control as long as it isn't used to pass third party traffic. This means no phone patch for sure. I don't know the answer if the voice repeater is being used by a traffic net to pass third party traffic. Anyone care to comment?

>4. Is it legal to make a repeater that changes its output frequency
>   via DTMF signals (and appropriate security codes a la phone patch)?

Users may bring up auxiliary functions of a repeater system by on channel signalling. This isn't considered acting as a control operator. Whether this allows bringing up another transmitter or changing the output frequency is questionable as this appears to be acting as control operator. The control operator may of course do this at any time via the auxiliary control frequency or wireline. This is another grey area that I don't feel completely competent to answer.

>6. Would a 100W 10m Transmitter to an antenna, say, 100 feet away, damage
>   one of those full-coverage scanners? Would a 1KW Transmitter? 2m?
>   It just seems like that would generate a lot of energy at the antenna
>   of the scanner-- how much is too much?

This should not be a problem. A 100 watt transmitter working into a 50 ohm load will generate about 70 volts of RF. Field strength falls off to the inverse square of the distance. At 100 feet the RF voltage across 50 ohms should be 1/10,000 of the voltage at one foot. So the scanner should see no more than approximately 7 millivolts at it's input. A one kilowatt transmitter in the same circumstances would produce about 22 millivolts at the scanner. That shouldn't cause any problems. This has been a simplified calculation ignoring near field effects, but should be ballpark for this situation. At 80 meters the numbers would be somewhat different as near field effects would predominate and you could see volts of signal at the scanner.

Gee, Franklin, why am I not surprised that somebody from Qualcomm would make this statement? :-)

Seriously, I doubt that any civilization that really wanted us to detect its signals would be spreading them, precisely because that would expand the search space horribly without providing any real compensating advantage. It's already plenty big even if you consider only coherent narrowband signals.

Any RF signal intended as a sign of intelligent life must be readily distinguishable from naturally generated signals. We know how to search for stable, coherent, narrowband signals on a large scale. And there are very few natural processes that generate them. So the concensus has been that SETI should concentrate on looking for them them.

Sure, maybe this is a bit like the drunk who, when asked why he was searching for a contact lens on the north side of the street he knows he dropped on the south side, replied "Yeah, but the light is much better over here." But in SETI you don't know how many contact lenses there are or how they're distributed, so you might as well look in all the easy places before you spend a lot of effort looking in the hard places.

And just to show you that the use of spread spectrum doesn't necessarily indicate the presence of intelligent life, consider GPS. :-)

Phil

(description omitted)

I started giving it serious thought when I read the original post. However, as I mentioned, a large number of club officers seem to be among those who are growing frustrated with the direction the club is taking.

On the other hand, if we have another meeting like the November one, the same club officers may want to relegate Robert to the role of dummy load and try transmitting with something else. [:-)] The situation is still unformed, and only time will tell.

Who knows, people may be waiting for someone to step forward and catalyze it. (Now if I could only attend the "Friday Lunch Bunch" sessions more often; that's where most of this discussion/dissent goes on, and where I'd have the best chance at becoming involved.)

BTW, at least one of the dissenting club officers already runs his own repeater. If having a repeater actually mattered, we may well have one to start with. (It's not clear to me that having our own repeater would be strictly necessary, however. Somewhere to talk would be nice, but somewhere *run by us* may not be a requirement.)

+---------------

Every so often I wonder if perhaps the FCC should add some (largeish) chunk of HF to the Novice license for the express purpose of SS experimentation. My thought at those times runs along the lines of, if we can get SS in use more on HF, there will be incentive for more hams to use it in favor of other modes that are in many ways less efficient (in terms of spectrum usage). (It's also a gripe of sorts that the Novice license is virtually useless for such experimentation; on HF, Novices can't do *anything* that might advance the art. One of the reasons I like the entry-level Tech license so much is that there is finally an entry-level license where the folks who want to push the boundaries a bit are actually allowed to do so....)

If doing this with HF is "too much", a chunk of 6m might well do instead....

It seems to me that we now have an entry-level license that can encourage technical types to experiment with VHF/UHF/microwave. Great. But increasingly it's HF that needs the breakthrough. What say to giving the Novice entry-level license some leeway to play with modes like SS that can reduce the overcrowding problem? (Please note that this suggestion says *nothing* one way ot the other about Morse code; that issue is irrelevant to this one. This is the *only* change I propose: adding SS to the Novice license in a way that would encourage its use.)

Of course, for this to work, it would be necessary to make SS equipment available. Perhaps we should be putting on our thinking caps and working out SS kits to get them started with.

Another thing that would be useful to SS in general would be a relaxing of the Part 97 rules concerning it, especially with respect to allowable "codings". My idea here is to have one or more "SS coordinators", similar to repeater coordinators, which would have the job of coordinating SS codings and possibly frequencies/frequency ranges. This would allow the FCC to open SS to more codings, with the proviso that only the SS coordinators (or an unbrella organization thereof) would be able to ask the FCC to okay a coding for use. (That simplifies the FCC's job considerably over requiring individual hams to get an okay from the FCC.)

Just a few thoughts (and I'd like to try out SS myself once I have the time and the equipment).

I find it a refreshing change from the umpteen code/no-code "discussions", reorganization stuff, and ARRL bashing.

I also perceive that the original poster was trying to solicit ideas from we hams, who are supposed to know all there is about radio.

ps67@UMAIL.UMD.EDU ("Paul W. SCHLECK") writes:

>privileges. There was also concern about excessive band loading on
>2m.

I challenge any ham to prove that there is excessive band loading
(as opposed to poor planning and coordination) anywhere in the USA
on 2 meters or any VHF or UHF band.

>Hugh says that comments on the issue have been split right down the
>middle. He is very concerned that the new regulations will divide
>amateur radio. He brought up 3 key goals of license restucturing, and
>why he felt that the new license might not be of significant
>impact:

if you further divide the divided by whether or not MOST of their
operation is ABOVE or BELOW 30 MHz, I would bet you will find there
is some correlation between whiners and HF'ers.

>1. An influx of new, quality hams. Any new restructuring in and of
>itself will not dramatically increase our ranks. No-Code is not a panacea
>and it should not be though of as such. Any serious effort to recruit new
>hams with this new license should be accompanied by an appropriate
>recruting/PR effort. VE's turning in their accredidation over disagreement
>with the new license will not achieve this goal.

This is a very important point.

>2. A dramatic increase in amateurs on the UHF and Microwave bands,
>to prevent licensed and unlicensed encroachment on our bands from Part 15
>devices, HDTV, cellular phone, satellite communications, etc. Giving
>away the lower VHF bands to new hams might give us the same band
>loading problems, only more so. The ARRL felt (whether you agree with
>it or not) that a 220-and-up license would force new hams to break new
>ground on the upper bands.

Any ham who believes the band is overloaded should be the first to QSY.

To expect to jump start the higher bands like 33cm and on up with just
the newcomers is assinine and DANGEROUS to amateur radio. Doing that
would hasten the loss of those bands due to the lack of operators who
are in contact with the rest of amateur radio.

>3. Acceptance and assimilation of these new hams into the mainstream
>of the hobby. Again, bitter divisiveness, shunning, old Tech's using
>a /C suffix, and other childish games will not make these new hams feel
>welcome. If this new license, as sensible and well though out as it may be,
>causes more divisiveness and infighting (possibly played out on the ham
>bands), then it may hurt more than help amateur radio.

Any ham who is not ready to accept the new Technicians on the granted
spectrum should send their form 660 into Gettysburg ASAP.

>As was stated previously, the stream of comments coming in to League

>officials on the issue have been split 50/50. If you write the ARRL, and I encourage you to do so, please consider the following in your letter:

>1. Will 6m TVI be a problem? Why/Why not?

Certainly not if there remains very little available equipment and 2 meters remains the magnet band.

>2. Will 2m band loading be a problem? Why/Why not?

Even the 2 meter band is vastly underutilized compared to what we could do with it. If hams want a band they can do sloppy planning and coordination on, own private unshared repeater frequencies, etc., then I suggest they QSY to 23cm or preferrably higher.

>3. What recruitment efforts do you and/or your club have in place to test, train, and accept these new hams?

Very little at present but now that a real possibility exists for a whole group of people to become licensed that never would before, this is something that needs to be done. I am currently working on coordinating and possibly teaching a class beginning in January or February just dedicated to the Technician class (new Techs or Novice upgrades).

>4. What kind of impact will this new license have on use of the UHF and Microwave bands?

Hopefully an across the board increase. More likely, as the perceived overloading of 2 meters takes place, which will extend to 70cm due to the availability of so many good dual-band radios, some hams will move on up to higher frequencies to "escape" the crowd.

It is far better that the paranoid and anti-social move away rather than the naive beginners.

>5. Will the new license cause a splitting of hams into code/no-code camps? What can you and/or your club do to make these hams feel welcome and smooth over ruffled feathers among existing hams?

Big cities will have this problem because there are enough of any subset of hams around to form their own clubs and cliques. Smaller towns and rural areas are not likely to see this as a significant problem.

>Sorry this post is so long, but I had to get in all the information. Please don't flame/write me, flame/write the ARRL.

I'll write and post, ok?

>fossilize?

Considering that today you can dial up an answering machine in the
Kremlin from your car phone, there is clearly going to be from now and
forever more, a means to merely communicate anywhere, very simply.

Amateur radio still has a place. That place is for people who want to
do more (even just a little more) than mere communication. Everything
from emergency communication readiness to development of packet radio
networks will still be taking place ... if we want to.

There is no need to drop technical tests. There will be a need to revise
those tests. Perhaps one of the things we need to set up next is for a
system of better revising and developing tests to keep up with the matters
that amateur radio operates on and the continuously increasing technology.

here we go again. "remove the code
requirement for those who find it unsuited to
their needs and tastes" another classic!! as a public school teacher for the
past 19 years, i have seen the results of
"lowering the standards" to make things
easier forthe minorities. in my profession, i
never had had much choice. follow the
dictates of the school board or find another
job. well, when it comes to signing my
name to a "no-code" amateur license, i do
have a choice. as of today, i am returning my arrl/vec
certificate to protest the decision of
the fcc. this won't amount to much but it
will make me feel a lot better about
what the bureau has done. the action i am taking will amount to
very little, if anything, but it will make
me feel better about a sad and
sickening decision by the fcc. at
least i will know that i'm not the one
to perpetuate this "give in" process
one step further. i like amatuer radio;
i am proud to be part of it; i get a
lot a lot of enjoyment from it; i hate
to think that every pervert going down
the highway
may get the chance to take these things
away from me

I have a project that requires a low power AM or FM transmitter with
decent audio quality. This transmitter must be legal (Part 15) to
operate, or be able to be made legal under the FCC license free
statutes.

Transmitters like this are in use on college campuses, and similar
situations where coverage of a single building is required. They feed
the signal into the power lines, and hence do not radiate beyond the
building.

I saw two such units at a recent hamfest, and almost bought them, but
did not have a need for them at that time. (I.e. I kick myself) the
prices were very reasonable.

If someone on the net has such a unit for sale (LPB or PANAXIS or
similar type system) at a price that will not break my modest bankbook,
please send EMAIL to

flash@lopez.UUCP

Thanks!

>22 millivolts at the scanner. That shouldn't cause any problems. This
>has been a simplified calculation ignoring near field effects, but
>should be ballpark for this situation. At 80 meters the numbers would
>be somewhat different as near field effects would predominate and you
>could see volts of signal at the scanner.

>Gary KE4ZV

The RF voltage field from a radio transmitter falls off as the INVERSE of
the distance, not the INVERSE SQUARE.  One Kilowatt ERP generates a field
of 186 millivolts per meter at one mile, in the absence of attenuation.
At 100 feet, the RF field would be 186*5280/100 or 9.82 volts per meter.

> When I took my pilot training in the Air Force, CW was a requirement. At least, you had to learn the characters. This was because the radio station identifiers were sent in Morse. One of the first things you learned in instrument flying was that you must be sure to identify the station you tuned to make sure you didn't fly to the wrong place. You did this by listening th the station identifiers.
>
> Nowadays, many (if not all) stations use voice identifiers, so there may not even be a requirement to learn the morse characters now.

To my knowledge, there is no requirement to "learn Morse code" for any of the pilot ratings. I didn't say that it isn't USEFUL!

95% of the IDs for VORs, ILS's, NDBs are still given in Morse code. Don't worry, it's slow (about 7 wpm), and you can listen to it as long as necessary and stare at the Morse code dits and dahs on the Sectionals (airplane charts) until you're satisfied it's the right station.

My experience shows that knowing Morse code (while flying) is VERY USEFUL. Gee, it's nice not to have to stare at the Sectional to determine that what you're hearing is really what you want to hear. And in IFR flying, it's too busy sometimes to glance at the charts! Also, in the dark, it's hard to read. I've had other pilots express admiration at my being able to hear and understand the Morse code so quickly ("BOS" I say from the back seat. The pilot "How'd you do that???").

I've also heard a rumor (ONLY A RUMOR) that the FAA is considering removing the Morse code identifiers from the Sectionals, because they are difficult to find and read easily.

And there are some pilots (thankfully not too many) who don't even bother to listen to the Morse code and make sure it's the right station. Or, if anything, they listen for Morse code and if they hear ANY Morse code and the needle points to "approximately" the right direction, they use it.
I made the mistake of doing this only once (during student training).....the Morse code being sent was "TEST", meaning the VOR was down for maintenance. After "following" the VOR for about 15 minutes, the instructor said, "OK, take off the hood and tell me where we are"......We were NOWHERE close to where we should have been. "I learned about flying from that!"

An avid flyer,
Diana

Yes, it's legal, and yes, there are repeaters that do this.  One example
that comes to mind in YOUR AREA is the 70 centimeter (448.625? World Net)
on top of Mt Wachuset, MA, which is linked to 10 meter FM.  I spoke with
a ham in Oklahoma over 70 centimeter using this....I heard him better on
70 cm, than I did direct on 10 meter FM.

Yes.

There's one in Leominster, run by WA1DWS, but I forget the phone number.
```

Yeah Phil, but that is assuming they really want us to detect them.

Maybe they really have been here already and want nothibng to do with us.
Of course it would be different if we all knew CW. :-)

I can't believe this is a concern anymore. I used to use 6 meters all
the time, had it in the car, did all the VHF contests. My wife too.
All in all, except in the heat of a contest 6 meters has to be the
loneliest band around.

And if your really concerned with TVI, have you tried watching Cable
Channel 18 while running 2 meter packet lately?? Even my HT on low
power can wipe it out. And I think there are more people watching
Cable channel 18 than you are likely to find watching fringe channel
2 with rabbit ears.

Maybe this is another myth that should be put to rest once and for all.
6 meters != TVI.

|> in support of the new move. This is a lot weaker than what the news
|> release originally indicated he was saying.

I talked to my local section manager and he told me that the real problem was that since the FCC did not do exactly what the ARRL wanted they were not sure if they should support the new system.

Actually, I think the FCC solution is better than the ARRL solution.

I have read arguments that we should not allow the no-code techs on 6 meters since we will have more RFI problems. How does Morse code solve this problem?

I have read arguments that this will overload 2 meters. If this does happen then won't we move and use other bands (fully utilized 440MHz and begin to use 1.2 GHz!). Believe it or not this is a good thing. If we do not increase the utilization of our UHF and up bands we will loose them!

I have also read concern about this "splitting" the ham ranks into CODE and NO-CODE hams... What does the ability to send and receive Morse code have to do with good operating on a FM repeater, 2M SSB, digital work? Nothing at all. I think that we do have some work to Elmer the new hams so that they can be integrated easily into the hobby!

Please don't consider this a personal attack, but to those protesting the FCC decision on no-code by returning your VEC, GOOD! You don't belong in the hobby as leaders if you can't go with the majority, or at least have a positive attitude and impact. You really don't belong in the sensitive positions a VE is with such a negative attitude.

If you don't like the no-code, fine, but I'm glad you're not going to be the first contact point of authority for these new hams. Just what they need, a negative and spiteful attitude just as they enter the hobby!

Really? The PSK-1 is a licensed copy of the TAPR modem, which in turn
was a direct copy of a Japanese design (with some tweaking by W3IWI & co.).
Where do the royalties come in?

I dunno who that was, but I can tell you who it wasn't! :-(At slightly
above 45 deg N, SAREX was certainly a washout. After successfully QSO'ing
W5LFL, W0ORE, DP0SL, and U2MIR (very loose definition of "QSO" in the case
of DP0SL :-), this was a bitter pill to swallow.

```
Does anyone know whether the forthcoming STS-37 "all ham" mission will have
a more favorable inclination for us northerners?

Sorry, but STS-37 is another 28.5-degree mission.

Don't give up all hope, though...several astronauts are being recruited into the ranks as we speak, in the hope that future missions will carry amateur radio as well. No, I don't have any specifics, largely because nothing has even gotten to the proposal stage yet - but as more crewmembers become licensed, more opportunities will become available.

>are all using spread spectrum.

All true, except you are talking about evesdropping into existing QSOs. There is a possibility that some benevolent ETI community are sending out signals to catch the attention of others; like one-way CQs :-).

If this is so, they would want to transmit the simplest signal possible that looks artificial to the recipient. An unmodulated carrier.

In such a case, when they transmit in any given direction, they would also have to subtract the Doppler due to the orbit and spin of their planet.

This is already done at the receiving end of SETI equipment in the extremely narrow-band (e.g., META) searches. When the telescope is pointed in a given direction, the earth's spin and rotation around the sun is taken into account by appropriately slewing the LO as the object is tracked.

Not all SETI research is being done at such narrow bandwidths. META and son-of-META (the Argentinian search, whatever the name is) don't really have much choice, given the 80-odd foot antennas. The NASA searches have larger antennas to work with and can sustain larger bandwidths. This may be dated, but the JPL "sky survey," for example, were conducted at 32 Hz (sin(x)/x) "bandwidths" (should really be called "binwidths", but what the heck).

The sum total of the money used in SETI is not quite as bleak as you put it. It probably has barely reached the billion dollar point, if that. And, it is not *countless* hours of human effort, either. The hours are put in by only a handful of rather dedicated people. I doubt that there are more than a hundred or two professional researchers dedicated to SETI in the US and the Soviet Union combined. A drop in the bucket compared to a typical manned-mission at NASA, for example.

Actually, it's possible for an antenna to have an aperture ("capture area") much larger than the physical size. An example is small tuned loop antennas. Perhaps the little green men have figured out how to make a small antenna with a planet-sized aperture.

>and chassis grounds together? Actually, the real question is
>what will happen to cathode-current metering? I gotta admit, triodes
>in grounded-grid baffle me. Any help out there?

Well it's not clear if you want to run the amplifiers simultaneously or not. If you are only going to run them one at a time you can parallel the power supply connections, or better, you can switch the supply from one to the other. If you plan to have more than one amplifier active at the same time, then you must provide power supply decoupling for each amplifier to prevent RF from one getting into the other. This would be in the form of chokes and bypass caps mounted on each amplifier chassis. To meter cathode current, you will need a cathode resistor in each amplifier bridged with it's own metering circuit rather than a single meter in the power supply across a common cathode resistor.

>Along a similar line, can you think of any way in the world to
>also run a grounded-cathode tetrode (ie 4CX250 or 4CX1000) from the
>same HV supply as the triodes, at the same time? I don't think it's
>possible, but I could be wrong. (where will the B- be, at chassis or
>floating?)

Again you must use power supply decoupling to prevent RF feedback. The B- will be commoned to chassis. For cathode metering of the triode, you must supply a cathode resistor bridged by the metering circuit. The two stages may be link coupled or a series resonant input circuit may be used for the triode. You will need a screen supply for the tetrode. You may derive this from HV with a suitable regulator circuit or use a separate supply. The separate screen supply has the advantage of allowing you to switch the amplifier on and off with the screen supply for TR purposes. You will also need a control grid bias supply. That should be separate.

A few safety notes. If your cathode resistor fails, the metering circuits can become hot with HV. Mount them appropriately. Never operate a tetrode with screen voltage and no plate voltage or bye bye screen grid. Arrange your circuitry so that turning off the HV also turns off the screen supply. There is still a danger to the tetrode if you use a fuse in the HV. Consider a sense circuit

that interlocks HV with the screen supply. Your control grid and
screen supplies should be very stiff. There should be no change
in voltage with drive level.

What you suggest about a piece of sheet metal will work. I've seen
it in practice, on 2 meters, with a mobile mag-mount antenna on a
2X2 piece of sheet metal. It will work somewhat, but the suggestions
already posted to the net will most likely work better. Better yet
would be to purchase a radio shlack 5/8 wave vertical, which is
made to be mast-mounted, and keep the mag mount on your car.
In any case, I would suggest you get yourself a cheap SWR meter
before you do any experimentation.

Lines: 57

In article <53@bootsie.UUCP> olson@endor.harvard.edu (Eric Olson) writes:

-Hi again! Happy newt ears, everybody!
-
-I have a few questions, after some sleepless nights trying to read
-the entire ARRL Handbook...
-
-1. Is it legal to communicate via repeater in a band for which you are
-    not licensed? The specific example that I suspect will become a common
-    question is 2m->10m repeaters.

Yes. You may transmit in any band you are authorized, and if some other ham decides to re-transmit your signal for you, that's no concern of yours. You may want to indicate that you're using a crossband repeater, though, in case someone asks why you're on 10m FM as a novice/tech.
-
-2. Can I sign up to take the Tech class _with_ code, fail the code, and get
-    a no-code tech license?

As far as I know, unless they specifically mention this in the new VE rules.
-
-3. I'm confused about whether a repeater and/or phone patch can be run
-    without local direct control operator supervision. Are all those
-    repeaters out there really babysat all the time they're in use?
-    What about digipeaters and other packet radio stations?

Digipeaters are different beasts than voice repeaters. The part 97 rewrite has better wording with respect to what is and isn't OK w/ digi's. My local repeater is babysat, but many aren't. Part 97.85(a)-(i) deal with repeaters, and it seems that it would be ok, but I'd rather err on the side of safety.
-
-4. Is it legal to make a repeater that changes its output frequency
-    via DTMF signals (and appropriate security codes a la phone patch)?

I suppose so, as long as you forced it to ID before QSYing. Also, watch out for stomping on other repeaters - mustn't QRM others!
-
-5. Anybody know of dialup BBS's about Ham Radio in the Boston Area?

Sorry, I don't.
-
-6. Would a 100W 10m Transmitter to an antenna, say, 100 feet away, damage
-    one of those full-coverage scanners? Would a 1KW Transmitter? 2m?
-    It just seems like that would generate a lot of energy at the antenna
-    of the scanner-- how much is too much?

I wouldn't key it up if the scanner is on the same freq - but I don't think it'd damage it. 100W would _probably_ be ok, 1KW, ah, nah. You might want to try starting out low in power, looking for receiver desense in the scanner. Increase power until you notice degraded receiver performance. Stop there. You could put a stub on the receive antenna line tuned for the 10m area you work most often.

Look at it this way. It is probably a good thing we're getting rid of him as a
VE. Old military rule of thumb: If the grunts don't like the strategy, get
smarter grunts.

But we are. One of the main listed reasons that the Government puts up
with hams is to provide a reservoir of trained radio operators. Granted
that this is normally in emergency conditions. If we can help out the
Navy recruiters a little now - that's great.

We've got to keep intact the few legitimate reasons for Amateur Radios
existence.

Yes, but you have to read the rest of the announcement to understand
what they are doing...just what the Paul said...looking for input from
the membership to determine whether such action is required...the
announcment doesn't say that such action is positively forth-coming.

Since the ruling doesn't match what the league actually requested they
are asking the membership whether it is acceptable or not...Isn't this
how they should react?

SHF Microwave Parts Company
7102 W. 500 S.
LaPorte, Indiana 46350

This is a source of Solfan, MA-Com and other brands of X-band Gunn-diode oscillators and detectors, useful for communications, motion sensing, doppler radar, and testing radar detectors. ;-)   The devices are tuneable into the 10 GHz ham band. Prices start at $15. A book of plans is also available. Send SASE for brochure.

WB6IGP has written several good articles in _73_ magazine on how to use such devices for ham radio. See January 1987, October 1987, January 1989. See also _Ham Radio_, December 1989.

Well, you could just full wave rectify it, then just measure amplitude.
You could also get tricky, and run a VFO at a multiple of the frequency,
use a divider to devide down and PLL to lock to the tone, then use one of
the multiples to trigger an interrupt to trigger A/D to measure signal level
at that point. There are a lot of tricks to use, but once you get the
2400 (or 2500 hz tone from the russian birds) my understanding is you
just measure the level of the signal.

You might want to pick up a copy of the "Weather Satellite Handbook" or
"The Satellite Experimentors Handbook" for some hints.

I am interested in information on communicating with uo-14. I know that this

satellite was just opened for amateur use. The baudrate is 9600bps. I would

like to know the modulation used and information on the correct modem. What

type of software should be used when exchanging data with the bird? Must

one use ssb for the downlink as on the microsats? I would in addition like to know if the new DSP devices will be able to handle the uosat modem

standard

? Any other information as well would be appreciated.

I didn't say it was sure to happen; I said some hams are afraid of it.

> The
> way I see it, passing the novice and tech written exams to get
> on the air is EASIER than it used to be.

The codeless Tech is an entry-level license and should be compared to Novice, not to Tech-with-code. It is easier in terms of drudgework, but not in terms of degree of understanding of radio required.

> Please explain to me why the no-code license is going to cause a
> big increase in super-techie types when the test is not super-techie?

Because the attitude among many RF professionals is that the old ham requirements, with heavy emphasis on code, are simply outdated and antiquarian. There have been messages on this newsgroup, from people who ought to know, saying that there is considerable interest in the new license among EE faculty and other such people.

> OLDE-PHARTE NOT IN THE LEAST AFFRAID OF YOUR "influx of sophisticated
> technical people" CUZ I'LL BELEIVE IT WHEN I SEE IT AND I'LL GET OFF
> MY SOAP-BOX WHEN YOU QUIT YOUR PATHETIC WHINING AND UNFOUNDED
> SPECULATION- Herbi (not of 14.313 fame) back to my DSP code, KM4JN

Why is any opinion you disagree with "pathetic whining"?

Anyhow, you're refuting things that I didn't say. I would *support* a general toughening of the theory exams, and the only reason I consider the codeless Tech exams acceptable is that, being entry-level, this license is intended to compare with Novice rather than Tech-with-code.

(My newsfeed here is getting decidedly erratic...Please e-mail comments to me as well as posting them.)

There has been a lot of controversy surrounding the .legal group portion of this proposal. Many posters have had problems with the name, on several grounds. I asked for a better suggestion, and Bill Davidsen (I think...please correct me if I'm wrong) suggested .policy. I've given it a lot of thought, and have decided it's a reasonable suggestion. I haven't seen any comment one way or the other, so I'm asking: Is this a better idea than .legal for a group concerned with the endless legalities and such of ham radio?

While I'm here, I'll add that I'm going to extend the discussion period a week, until January 7, both so we can resolve this issue before we go to a vote and to make sure everyone has an opportunity to comment regardless of the holidays. I've spoken via E-mail with Ekiot Lear, and he sees no problem with that.

We have to be careful to not make the opposite assumption -- that if the ranks DO swell that they WERE kept out by the code. The swell may be due to increased advertising, or due to people who never even tried the code and don't know if they would have had trouble or not.

Summary:Drop Elements 1b & 1c!

In article <58130008@hpcupt1.cup.hp.com> holly@hpcupt1.cup.hp.com (Jim Hollenback) writes:

```
+I always find it interesting that it is the long-term Technicians that
                             ---------------------
+propose the two level or classes license structure.  I wonder want the
+real motivation is to propose the present Techs should be grandfathered
+to full HF priviledges.  I feel it more they want the full HF priviledges
+and don't want to learn the code.  Actually there is more to learning
     ----------------------------
+the code on upgrading.  It also is learning the answers to more theroy
+questions.  Otherwise there would be few if any General class license
+holders.
```

Your errors in sentence structure and spelling notwithstanding, the real reason lies in the perception that there is little if any difference between the Tech (element 3, pre-Novice Enhancement) and General class licensee.

We already learned the code, and demonstrated that skill at 5 WPM.

In fact, some of us have technical skills that far surpass those of our brethern with General tickets; the reason? While the Generals have been busy blasting away at 14.313, the Techs have been building antennas for OSCAR, amps for 1.2 GHz, linked microwave systems at 10 GHz and playing with the packet and DSP techniques...done any of that stuff??!!

```
+
+Most countries that have fewer classes than the US still have some
+minimal requirement for minimal priviledges, and a full priviledge
+class for a more difficult exam along with a no-code license.  This is
+a more reasonable proposal.
+
+Jim, WA6SDM
+jholly@hpcupt1.cup.hp.com
```

Most countries are not AMERICA! I would suggest you go have a look and see how many jobs are available for buggy-whip makers and then get grip on reality! This nonsense about CW has just about run it's course, most hams are beginning to understand that the FCC isn't going to play the "good-ole-boy" games that the OF's in the ARRL have been whimpering about for the last 40 years. It's not 1955 anymore, in case you haven't noticed!

A two-tier license structure, or whatever. Just so long as the CW test is kicked back to 5 WPM. There's really no reason whatsoever for anything faster in terms of the ITU regs, or the skill level of the operator.

If you could explain ONE real reason why that 13 WPM/Element 1b makes a ham any better, I'd love to hear it! To my way of thinking, it's just another stumbling block - another way of keeping the inner-sanctum of HF from people that would be interested in it bringing technical growth to it! (no :-)'s here...I'm very serious about this.)

And now, since the no-code question has been beaten to death, let's all start a spelling flame war. We can all pick apart every message with any spelling or grammer errors, and argue endlessly about "which" and "who" and "lose" and "loose", and "its" versus "it's".

This is heavy sarcasm, in case you didn't notice. Many of the people who post to USEnet do not speak English as a first language, and some seem to be struggling mightily with it at all. I have seen posts where it took considerable effort to decipher the meaning of a request, but nobody popped in with grammer lessons. Until rec.ham-radio.

Apologies to anyone if it seemed that I was starting a "spelling flame war." I did not originally criticize anyone's spelling or usage. I got involved when someone else posted rules of grammar that were incorrect. I realized

this was off topic and was posting messages only to correct actual
misstatements of fact in my professional specialty (English syntax).

There was discussion some time ago on this subject and someone siad they ahd
never heard CW between 27 and 28Mhz....Well Christmas day while mobiling to my
mom's, I was tuning the Kenwood 680 across the HF "Freeband" area to see what
was there and lo and behold about 27.425 I heard a CW QSO between a guy in
Haiti and a guy in the states!!!!...BOTH running CW!!! and good fists too!
The guy in haiti was 24, name Rick...and his rig was a 553 (whatever that
is!)..he had to sign because of TVI (dont you love it!)...I couldnt quite pull
the guy in the states out of the noise but he was there somewhere along the
mid coast...i did heard him ask Rick if he would be on 10mtrs later?????
Hmmmmm Guess there IS CW being used outside the ham bands after all.....
(and the guys evidently were hams anyway!)
I kinda got interested in seeing what 10mtrs was like after hearing that and
going into the Novice band work N1CAJ on 10cw while MOBILE using the mic PTT
on my 680 and the rig in FULL cw bk-in...no cw key plugged in and NO sidetone
either!! It was easy but Frank and I had a great QSO for about 30 minutes or
so....Gee I kinda misssed that fun on 10m...maybe it time to get the knee key
out again!
See ya on 10mtr CW???

Spelling has never been my strong point. I try to use correct syntax and grammar. I welcome ANY effort by non-native English speakers. However, I note that it is the native-born Americans who seem to favor us most with the consistent use of "there" instead of "their", "liscense", "real" where "really" is called for, etc, etc.
I feel better already.......   Bob   W3OTC

When I'm struck by the poor English in an article on the net, I usually look up to the headers to see if the posting* originated from a non-English speaking country, or someone whose name might indicate that English is not his native language. If would seem so, I merely feel sympathy for someone who has had to learn one of the most difficult languages in existence, and try my best to understand what he meant.

But when the posting originates from someone with a typically english-speaker's name and from somewhere that you could reasonably expect to have literate people, I can only assume that the same haste was used to form the thoughts and opinions as to compose the message. How much weight should I give such apparently half-baked ideas?

It is a regrettable truth that your ability to communicate your ideas clearly will greatly affect the influence they have on other people. If you can't communicate them, the most brilliant thoughts are of no value.

Furthermore, incorrect spelling reduces communication. Indeed, the person who suspects he has spelled a word incorrectly and marks it with (?sp) has thus indicated that he's not sure of the spelling, but he's also implied that you, the reader, aren't worth his time or effort to go and look up the correct form. How is a one to grade the ideas in a posting which implies such contempt for the reader?

Thus I would urge people who wish to have their ideas carefully considered by their readers to make the effort to ensure that their posting is clear, understandable, logical, spelled properly, and reasonably grammatically correct. This is an informal medium, and thus formal language is not required, but if you want to get your ideas across and make your point, you have to make the effort.

Sloppy writing indicates sloppy thinking.

It wouldn't be "remembering", it would be news to me.
(a) non-hams have been trying for decades to get the CW requirement eliminated.
(b) The FCC recognizes Amateur Radio as a hobby, not an FCC organization. I
don't think they care a hoot about what kind of "talent" goes into the hobby,
so long as the "talent" obeys their rules.

>People forget where the no-code proposal came from. The FCC has been
>talking about it since 1940 and, until now, had been shouted down by
>the ham community every time.

I don't know about 1940, but I do seem to remember in 1955 there was some
noise from wannabe-hams demanding that the FCC drop the code requirements.
the response by the FCC was to open the 11-meter band (in 1958, I think) to
a no-code license category.

You are correct, however, in noting that the Ham community opposed lowering the
entry requirements. It opposed the simplification of the theory exams. It
opposed the elimination of one of the entry requirements (CW). It will
continue to oppose these until those in the hobby who feel differently become
the majority. I believe that, in the next year, there will be a "new majority"
because of the recent rules change. As has been said here before, it's a new
hobby and we will have to adjust to it; but some of us reserve the right to
say "I told you so".

Xref: gmdzi rec.radio.shortwave:3235 rec.ham-radio:18474 rec.ham-radio.packet:3297

I measured the Mark/Space output of my PK232 in RTTY mode using a scope and with the PK232 in loop back mode as described in the PK232 manual (green and white wires connected on the Radio output cable). I started transmitting using this setup in RTTY mode. The characters typed were received OK but when I monitored the Mark/Space scope output on the PK232, instead of the correct cross pattern on the scope I got a signal slightly out of 90 degrees phase:

```
        ^                  ^
     __| |__                 _\ \__
    <__| |__>               <__\ \_>
       | |                      \ \
        V                     V

    Correct Mark/Space           Measured Mark/Space
    RTTY signal pattern          RTTY signal pattern
```

Does anyone know how to adjust the PK232 so that the Mark and Space signals be correctly at 90 degrees off phase ?

In addition, can anyone e-mail me the description of the modifications to the PK232 in order to minimise RFI pick-up. Any other mods will be apreciated as well.

```

I built one of the Hamtronics converters. Getting the local oscillator stablized so that it would start reliably and still get a clean waveform was a bear. If I hadn't had a spectrum analyser handy, I would probably have given up. It works ok now, however. I personally like the converters from Advanced Receiver Research. They are stable, sensitive, and have reasonable noise figures. The only problem I have had is with lightning induced surges blowing the gasfets.

>   using?

I'm using the G3RUH design from Radiokit. The modem went together easily. It tuned up cleanly. And it works. I did have the advantage of a spectrum analyser, dual trace 200 Mhz scope, and a frequency counter to make it play, but these shouldn't be necessary. The Paccomm unit seems to be a solid unit, but I haven't had any personal experience with it.

>3. I have read that the Paccomm PSK-1 modem will not work with the

I would recomend a simple straight TNC2 clone such as the MFJ1270B or the Paccomm Tiny 2. I have used both extensively to interface various modems, G3RUH, WA4DSY 56k, Kantronic 2400, etc. Running KISS is a simple ROM replacement. I wouldn't bother with the multimode wonder boxes. The compromises inherent in a do everything box mean that they do nothing particularly well. Also, the external modems we are talking about are specifically designed to interface with the TNC2 and tying them to one of the multimode boxes is not straight forward. You can do it with the PK232, I've installed them for friends, but it's not simple. You have to go inside and find the signals that you need, cut traces, and patch in your own wiring. With the TNC2, the modems connect cleanly to the external modem disconnect header.

> you folks using? Do I need a 2m all-band rig?

The main thing you may need is a "mode J" filter to keep the 2 meter signal and it's harmonics out of the converter. Spectrum International sells a nice one. You can build one fairly easily if you are handy with metalworking tools.

I support the change of name to policy. The problem with legal in my mind
is that this is an international group and legal issues vary from one
administration to another. Policy encompasses a wider range of issues
that could be more inclusive of our international friends.

I still strongly urge the creation of a tech group as well as renaming
the base group to misc. These changes should minimize inappropriate
cross posts and give a pure tech enviornment to those who have demanded
it. If our mailing list administrator would agree to handle the tech
group as a separate mailing, I think that a lot of people would be happy.

I wouldn't be surprised if the RATIO of technical to non-technical types remains static. Especially if we don't do a good recruiting job. Still, this should result in relatively large NUMBER of new technical types joining the hobby. Many techies are not keen on operating events and could care less about the Morse operating mode. My personal recruiting count of techie EEs who have either already taken the written exams or are brushing up for them since the no-code license announcement stands at four. These folks have little interest in operating for operating's sake. They don't care about autopatches, they already have cellular phones. They want to try new ideas that they aren't allowed to try at work.

It's been my experience that the "autopatch amateurs" aren't very active amateurs. We have a couple of dozen club members who entered the old fashioned way who I would call "autopatch amateurs". They are almost never heard in QSO with anyone other than their spouses and are rarely on the air at all except to use the patch. The club tends to look at them simply as revenue enhancement. A few more won't appreciably effect our operations.

> Please explain to me why the no-code license is going to cause a
> big increase in super-techie types when the test is not super-techie?

Take this up with the FCC. They're the ones who decided not to require an Extra level written exam for the new class. My personal opinion is that requiring a super tough written exam would discourage youngsters who want to experiment and learn by doing. Amateur radio is supposed to be a lifelong learning and self-training service. If the entry requirement is at the expert level, then the purpose of the service is diluted. For those few who simply must have wallpaper to chart their progress, I'm sure the League could step in with programs similar to their high speed CW certificates, but this time testing technical progress. One certificate that already does this is AMSAT's ZRO Memorial Award. It measures your ability to receive extremely weak signals. Yeah, the signals are CW, but that gives the satellite enhusiasts a real reason to teach themselves Morse rather than being forced into it by government regulation. Continuous self training is one of the major purposes of amateur radio. A complex licensing structure does not necessarily aid this purpose, especially if it discourages entry in the first place by imposing requirements considered not germaine at the time by new entrants. Once they're hooked, they can learn what they need to know to operate new modes or experiment with new technologies. If this results in some "amateurish" operating practices on the air for a while as they master new skills, so be it. That's what "amateur" radio is supposed to be about. Otherwise we'd call it "professional" radio.

Very true. It's difficult to prove a positive while one negative can totally discredit a theory. I should of said that we would know that code was not the ONLY thing keeping them out of amateur radio. Amateur radio may have a bad reputation with the general public for many reasons.

While I am a strong supporter of the no-code license for VHF/UHF/SHF, there is one, and one only, very good reason to require a stumbling block to access to HF. Crowding. The HF bands are the only bands in amateur radio that are at or near saturation. In the commercial realm when bands are saturated the FCC resorts to a lottery. In the amateur HF bands the crowd control method is demonstration of high speed Morse operation. Not that high speed Morse skills are essential for HF operation, nor that passing a test is the best way to develop high speed Morse skills, but simply as a crowd control measure. If you would prefer a lottery, I wouldn't mind, but at least the Morse requirement gives amateurs a choice on whether they wish to operate HF or not rather than depending on the luck of the draw. While I am licensed to operate on the HF bands, I rarely do because of the crowding and zoo-like atmosphere that already exists there. I'm sure that most operators wouldn't like to see it get worse. If you have a congestion control method that is better than the Morse hoop or a lottery, then spit it out. Don't think that the Morse requirement makes a better amateur, it doesn't. Address the real issue, spectrum congestion.

I agree. <<Surprised?>> I see no sense to a code test for a VHF only license. I see a certain amount of sense to requiring it for an HF license, not so much for what the licensee wants to do but for what someone else might need for him to do in a time of distress. Those circumstances don't arise as often as they once did, but circumstances are not yet such that it will NEVER happen again.

Having said that, however, I see little sense in reserving huge chunks of HF spectrum primarily for CW. If CW operators are as good as they say are, wading through QRM from other modes ought to be a breeze. [:->

Actually, this was a rather timely comment. I got an ARRL memorandum
yesterday that announced that there was an interesting little tid-bit
in the Federal register recently that eliminated removal of all but
RACES operations when the President involkes his War Powers. This
is all from memory folks so I'm likely to get a little of this wrong
but essentially it is now a joint decision making authority between
NTIA(that is the government radio user's equivalent of FCC) and
FCC to determine proper spectrum management during such emergency
situations, and the radio user's responsibility to "stay tuned" to
any change in their respective authorizations during such times. All
pre-aranged shut-down of existing services as defined in the rules
are now null and void I guess. The effectivity of this ruling was
mid December if I recall so it is probably already in effect.

What I got out of the announcement was (to paraphrase): We didn't get what we asked for and what we asked for came about after consulting our membership, so now we have to go ask them again to know how we should react to this ruling.

Michaels final sentence is what anyone who is interested should do to influence this opinion. The person you want to write to is your Division Director...you can find his/her address on Page 8 of QST. Let em know what you think. That is the best, most direct way to influence the League's position on an issue. Try it...you may be pleasantly suprised!

Well, they aren't anywhere near Palmdale...I listened this weekend and heard only S9 or less signals while I was down there....(If they were in Palmdale I would have heard pretty strong ground wave...that place is FLAT...) The directions I got were all Easterly in nature.

And there are a total of 55 questions. If you are upgrading, you don't
need to pass the 2a section. The test may have it on it.

> In other words, y
> DO have to pass the Novice written exam before you can take the Technician
> written exam, you DO have to pass the Technician written exam before you can
> take the General written exam, etc.

Please show me in the rules where it says this. The rules only say
you must pass 2a and 3a. They do not say you must pass 2a before taking
3a, nor do they say you may not take them both at the same time. If the
VEC creates a Technician written exam of two parts (2a and 3a) you need
only take that one test to become a Tech. In fact, there are places that
give you both at the same time.

The rules make NO reference to Technician Written Exam or Novice
Written Exam. Just 2a, 3a, etc. If you want to make up your own
terminology, please have it conform to the rules.

Yes, by all means, judge people based on the country they live in, or the "ethnic" content of their name. DON'T EVER consider that the net is an informal medium of exchange, and that poorly spelled words DON'T mean poorly formed ideas. Forget the fact that there are some pretty rotten keyboards. Forget the fact that some English words just do not spell right. Forget that the world has become a small place, and people can move about -- some of those people from non-English speaking countries even move to the U.S.. Some of them even anglicize their names. Forget that there are few, if any, people who are payed to post to the net, and thus most people must do it in the limited time they have. Demand that every post go through a peer review process to remove spelling errors and logic flaws. Make all them damn foreigners hire someone to write their posts for them, so that YOU don't have to think.

And since you are so picky here, you should know that countries do not speak, period. The people in them do speak. Thus, there is no such thing as an "English speaking country". The people may speak English. The official language may be English. But a country that speaks? No.

> . How is a one to grade the ideas
> in a posting which implies such contempt for the reader?

And how are we to grade the ideas from someone who judges the poster based on national origin?

> Sloppy writing indicates sloppy thinking.
>   - Brian

Sloppy thinking indicates sloppy thinking. Sloppy writing indicates sloppy writing. Poor spelling indicates poor spelling. Cute homilies like yours are just your justification for dismissing any ideas you don't like without any thought at all.

> *not "post" - a post is a wooden or metal object used to support things.

You post messages to the USEnet. These messages are known as "posts". I am sorry if you object to the term. That is your problem, though.

For those who were having difficulty with anonymous logins to nachos.ssesco.com, we have fixed the problem and the NASA elements are again available for FTP.

The host is nachos.ssesco.com [192.55.187.18] and the NASA element sets are in the directory /sat_elements/nasa.

The current version is NASA788.

-- MAJOR SOLAR FLARE ALERT --

DECEMBER 26, 1990

Flare Event Summary
Potential Impact Forecast

MAJOR ENERGETIC EVENT SUMMARY

Please note that this report is one day late due to the Christmas holidays.

A major solar flare occurred on 26 December from Region 6420. This flare reach a class X1.9/2B rating, but was not associated with any Type II or Type IV sweep frequency events as one might expect from a flare of this intensity. The Tenflare was an impulsive type, reaching a peak intensity at 14:02 UT on 26 December, only six minutes after it started. The flare was 31 minutes in duration, ending at 14:27 UT on 26 December. The location of this flare was east of the central meridian at a position of S26E21.

Satellite-level protons returned to background levels on 26 December and were not enhanced by this major energetic event.

Region 6420 is not expected to produce any more significant major flaring.

POTENTIAL TERRESTRIAL IMPACT FORECAST

This major flare is not expected to produce very significant terrestrial activity. There is a slight risk that some material was ejected by this flare, simply due to the power of this event. However, the lack of any significant sweep frequency events from this flare strongly suggests that any terrestrial impacts will likely be small.

The current prognosis suggests that geomagnetic activity may increase slightly over the next 24 hours, but no significant storming is anticipated. Activity may reach unsettled levels over middle latitudes with possible active periods over higher latitudes. Overall, activity should remain generally unsettled, with a return to more quiet levels on 29 December.

** End of Report **

Re: CW on 14.313
```

I heard KQ2C (or something like that) calling CQ there a couple nights
ago. It was all hopelessly legal; there were two polite QRL?s, followed
by a CQ. This turkey then has the chutzpah to claim that two SSB
stations were interfering with him ! That's the first time I've ever
heard that SSB can interfere with CW. Maybe KQ2C needs better filters. :)

I think this is the right idea, though. Convert 14.310-14.316 to a
digital subband.

I have a question regarding QSL cards. I'm a raw beginner, and
I've only had two QSOs so far. One of them was in Lithuania, so
I'm anxious to send a QSL card to make sure that I get one back.
However, I don't have any QSL cards yet. I have access to laser
printers and software that would allow me to make my own QSL card
layouts. Since I'm not sure how long I'll have my Novice call
(I want to upgrade soon), I'm reluctant to buy a lot of 500 cards.
Would it be considered bad form (no pun intended) to print some
QSL cards on regular paper, cut them out, and send them, rather
than having them printed professionally on heavy stock?

> eliminated.

The no-code movement began at WARC 1947 at Atlantic City, when several foreign delegations suggested that the code requirement had outlived its usefulness. If anything, the U.S. is a Johnny come lately in the no-code trend.

> because of the recent rules change. As has been said here before, it's

> to
> say "I told you so".

Boy, I wish I had a quarter for every worldly wise old-timer I heard say that in the 50's when the Novice and Technician Classes were created. You did know, didn't you, that the Novice and Technician Class licenses were the result of a communist plot to destroy civilization as we know it, and the holders thereof were NOT _REAL_ hams? R_E_A_L hams (whose only code test was at 13 wpm and who drew circuit diagrams on the written exam) should never talk to the strange new people with the weird (i.e., not 1 x 2 or 1 x 3) callsigns.

I've hacked a little on a version of NOS that Anders Klemets ported to System V UNIX. It uses shared memory and semaphores. Each application runs in a separate process and uses a simulated socket library to communicate with the server process. I don't think Anders sees it as anything more than an experiment because the

overhead of synchronization using semaphores does a good job of
gobbling up substantially more than a 10 MHz 68010 (my AT&T 3B1).
I made a change to interlock using a test-and-set instruction
on some shared memory before trying to get a major semaphore..it
increased the efficiency of the package enough so that it
is reasonably snappy, but I've had problems with synchronization
not working properly, so I can't call it a success.

Last thing first: Most important is the size: anything deviating from the
"standard" 3.5 x 5.5 is a nuisance to file.Light card stock (like index)
is quite a bit better than plain paper.

Most important thing is making cards count for something. There are lots of
common errors:

Putting the sender's call where the receiver's call should be.
Getting date wrong (epecially from evening to midnig

Omitting the mode. "2xCW" or "2xSSB" etc are fine. AlA, etc, are not
especially desirabe.

Why some insist on putting a frequency to the nearest 10 Hz escapes me.

As for your LY: very fine first or 2nd qso.

Could say more, but I've been going for about 18 hours so far today, and
I'm quitting for the night.

Ditch the transistor. Don't even think of trying for a tube.
Build a SPARK GAP.

I just got a form letter from the ARRL offering me another chance to
renew (I had not done so due to increase in rates) and offered a free
book (I have one of every one they offered that was interesting).
I had, just after the FCC decision on No-Code Tech was announced,
to go ahead and take them up on it.

```
I will send it back to them, addressed to Larry Price, without a check,
instructing him to send me the offer again once the ARRL decides NOT
to pursue any changes to the new Technician privileges.

It's not just the new Techs that the ARRL could offend by such a petition.

>it and working from the inside, their views may be underrepresented.

Right.  The ARRL has already offended quite many hams who have subsequently
left (or never joined) the League.  In addition to the fact that the league
does NOT represent all of amateur radio, it certainly does not represent
those people who would make up what amateur radio COULD be, even if they
are potential League members.

>The people on ARRL staff that I have worked with, and our Southwest
>Division Director (Fried Hein) certainly don't fit your description.

>I get really tired of ARRL bashing. At least they actually do something
>to try to improve the hobby - within the limits set by their voting
>members.

The ARRL is, perhaps, a FOLLOWER instead of a LEADER.

As long as the ARRL is strictly following the wishes of one group, how can
it possibly expect to attract membership from the other group.  If the ARRL
petitions to move the No-code tech boundary up from 30 MHz to 220 MHz, and
of the FCC goes along, I suspect this would serve to do as much damage to
the league itself, in addition to ham radio, as incentive licensing did, or
```

worse.

I wonder what the league's policies would turn out to be if they took into
consideration the position of EVERY ham AND every would-no no-code tech as
if the membership of the league consisted of all of them? I'd like to see
such a league. But the present means of operating at the ARRL serves
strictly to preserve the boundaries between differences of opinion among
hams and would-be hams, rather than try to get everyone together.

ARRL Letter Volume 9 Number 24 November 29, 1990 - Page 5 of 5

NEWS FROM CANADA

* The Canadian Radio Relay League and the Canadian Amateur Radio
  Federation met Oct. 14 to discuss a merger of the two groups. A draft
  constitution for a new, single Canadian organization was updated
  based on comments from boards of directors of the two bodies. The
  merger committee plans another meeting early in December, and
  tentative plans were made for the CRRL board and the CARF annual
  general meeting to be held "in a common location" in June, 1991.

* It may take a massive letter-writing campaign to Canada's Department of Commerce to get the new "Client Procedures Circular" rescinded, according to CRRL. The CPC, which will be published in its entirety in the December issue of QST Canada, is subtitled "Municipal Consultation on Non- Broadcasting Antennas," and is characterized by CRRL as "so poorly crafted that it lends itself to all kinds of interpretations and arbitrary decisions."

* Regarding new (as of Oct. 1) Canadian regulations based on the bandwidth of transmitted signals, that 1200-baud packet operation falls within the 6-kHz maximum bandwidth allowed on 160-12 meters (except 30 meters). CRRL and CARF ask that Amateurs NOT use 1200-baud packet on the HF bands "until the CRRL and CARF form a band planning committee and the matter has been studied."

CONFERENCE HONORS ARMSTRONG

Edwin Howard Armstrong, "the Major," would have been 100 years old this year. The centennial of his birth has spawned a number of projects and retrospectives, the latest of which was a conference held Nov. 16 at Columbia University, his alma mater and where for many years he was a faculty member.

Attending the conference, held at the Columbia Center for Telecommunications and Information Studies in New York City, was ARRL Executive Vice President David Sumner, K1ZZ. Sumner participated in discussions of papers presented at the conference, particularly those concerned with the commercial development of FM (which Armstrong invented) in the U.S.

Maj. Armstrong was widely regarded as having strong roots in Amateur Radio. Although his experimentation as a "ham" predated licensing, Armstrong helped build and operate the Radio Club of America station 1BCG that was the first to be heard by the League's Paul Godley at Ardrossan, Scotland, in 1921.

It was just this sort of unstructured, "amateur" experimentation that Armstrong carried over into his many technical breakthroughs, which included invention of the regenerative circuit (1912); the superheterodyne (1917); and wide band FM (1933).

Also present at the conference was Thomas Lewis of Skidmore College, who is helping produce the film "Empire of the Air," a PBS documentary about the early days of broadcasting that is scheduled for airing next fall. Lewis is pictured with Bruce Kelley, W2ICE, in the Oct. 19 issue of The ARRL Letter.

PLEASE GO AWAY

Here is the latest list of intruders in our HF bands which the ARRL has asked FCC's Treaty Branch to pursue with other countries as well as our own:

* 1813-1820 kHz, A2A (beacon transmitters);
* 7008, F1 (TTY idling and traffic);
* 14221, R7B/F1B (250/500 Hz shift TTY and Mux);
* 14312, F1 (high speed digital keying, 1 kHz shift);
* 18090, F1 (140 baud encrypted, 500 Hz shift);
* 18095.5, F1 (idling signal, 2 kHz shift);
* 18125, F1 (50 baud, 400 Hz shift, some encryption);
* 18138.5, F1 (140 baud, encrypted).

BRIEFS

* The League's latest move against the reallocation of part of the 220 MHz band to commercial interests was played out in court Nov. 16, when oral arguments were presented by the ARRL as plaintiff and the FCC as defendant, to the U.S. Court of Appeals, D.C. circuit. A panel of three judges heard the arguments and questioned both sides in the request for judicial review. The Court's decision is expected in a few weeks.

* The preliminary position on the 40-meter band contained in the FCC's Second Notice of Inquiry in Docket 89-554 generally was supported at the final 1990 meeting of the FCC WARC-92 Advisory Committee's Informal Working Group No. 1, held in Washington Nov. 8, according to EVP K1ZZ, who attended as a member of the working group. Background on this can be found in the Oct. 5 issue of The ARRL Letter and in Nov. QST.

FCC TWEAKS AMATEUR RULES

The Federal Communications Commission has addressed a number of proposals for changes to its Part 97 Rules for the Amateur Service, in response to petitions by the ARRL as well as several individuals. The Commission's Notice of Proposed Rule Making in Docket 90-561 was released Nov. 16. Here are the highlights:

* The ARRL asked that the terms "telecommand," telemetry," and "space telemetry" be defined in the Rules; FCC agreed. The terms "tactical call sign" and "digipeater" will not be codified.

* ARRL sought an increase in the minimum number of club members necessary to apply for a club station license, from two to four. But the Commission noted that no new club station licenses have been issued for some 13 years and "we do not foresee that we will resume doing so," so the point was moot. The League continues to urge the Commission to resume the issuance of new club station licenses.

* FCC declined a request to amend its Rule that states an Amateur station must be independent of all other radio apparatus installed on a ship or aircraft. The League's argument in this case was that a regulation already is in place prohibiting an Amateur signal from interfering with other apparatus aboard.

* In the matter of prohibition of automatic control of Amateur stations when third party traffic is being handled, the League sought a rules revision to put the responsibility for the content of such traffic on the originating Amateur station. The Commission, however, maintained that traffic content is the responsibility of every station, including those who retransmit communications, and proposed no change.

In a related matter, ARRL sought a clarification of Section 97.109(d), to emphasize that a Commission representative may order an automatically controlled station to shut down because of improper operation or harmful interference only after the alleged offending station has been given the opportunity for a hearing.

FCC denied this, saying that "the control operator must cease automatic control of the station upon notification by an Engineer in Charge that the station is transmitting improperly or causing interference to other stations, and the licensee is not entitled to a hearing before such notification."

* The FCC declined to amend its Rules to permit retransmissions of other services--NOAA weather and DOC propagation broadcasts--saying such transmissions are "routinely available over the air with inexpensive receivers."

* The FCC agreed to amend its Rule regarding compensation of club station operators, lowering the number of simultaneous bands on which bulletins and code practice must be transmitted from ten to six.

* A request to ease the FCC Rules regarding third party communications on behalf of someone holding an Amateur Radio license but not eligible to be a control operator of an FCC- licensed station was denied. The Commission said this had already been considered (in the most recent Rules rewrite) and denied at that time.

* A request by an individual Amateur to require stations to identify at the beginning of communications through a repeater was not included in the proposals, but FCC asked for comments in the matter.

* FCC declined to entertain a change in its Rules to incorporate due-process procedures in cases involving "quiet hours," saying that it was unnecessary.

* In the area of Special Operations, FCC agreed to:

1. Amend its Rules to delete the condition that an auxiliary station can be automatically controlled only when it is part of a repeater system, so that Amateur operators can experiment with new system configurations that use auxiliary links;

2. Expand the permissible types of space telemetry transmissions as requested by the ARRL;

3. Make minor changes in wording, including changing "remote control" to "telecommand."

* The FCC once again refused to change its Rules banning 10-meter power amplifiers, saying the ban "makes our enforcement procedures more efficient and effective."

* A request that persons whose Amateur station or operator license has been revoked or suspended be allowed to qualify as a volunteer examiner after a 10-year period was turned down.

Interested parties may file comments on or before Jan. 31, 1991; reply comments are due by March 4, 1991. Extensions of time are not contemplated, according to the FCC.

ARRL Letter Volume 9 Number 24 November 29, 1990 - Page 3 of 5

HAMS HELP TRACK ANOTHER ALLEGED JAMMER - (Continued)

"Barney" feels the heat

Barney at this point apparently became suspicious and for several days curtailed his transmitting.

Additional transmissions were noted on the TARA repeater, and on state police, county radio, and the Norristown Fire Department frequencies, as Barney gradually resumed operations beginning the weekend of Sept. 15-16. FCC engineers meanwhile narrowed the source down to a particular house in the congested area.

For the next two weeks monitoring increased, as efforts began to identify the occupants of the house, which appeared to be divided into apartments. Any search warrant issued would have to be for a specific apartment rather than for the whole building.

At the end of September the U.S. Attorney was presented with evidence gathered up to that time. Montgomery County Communications Chief Dennis Parker and Norristown Fire Department Chief Joe DeDominic were asked to provide evidence they had gathered about interference to their operations and to file formal complaints.

In early October the jamming increased, and included harrassment of the Norristown F.D. on Oct 20, 23, and 26. In one transmission Barney tried to recall several trucks from a fire call. By that time the fire department had filed a formal complaint with the FCC.

On Oct. 19, U.S. marshals and FCC personnel, acting on a search warrant issued by the U.S. Attorney, entered the suspect house. But no radio equipment was found.

Although the raid was a disappointment, the FCC continued its probe.

The landlord of the row house next to the house that had been searched told Rahtes that one of his tenants was known to have several radios and antennas in his room at the front of the building. The landlord supplied additional information, such as the tenant's work hours, which seemed to confirm that this individual was indeed the likely suspect.

>From the landlord's first floor apartment Rahtes took field strength measurements, and was able to hear Barney operating his equipment through the thin walls of the building.

On Nov 1, the Radio Amateur Civil Emergency Service repeater in Eagleville, PA, reported unauthorized access to its 911 emergency system. RACES net members were being beeped day and night, adding to the FCC's case for securing another search warrant, which soon was issued.

TARA president E.C. "Gene" Pressler, W3ZXV, joined FCC personnel and U.S. marshals to enter the suspect premises. Several pieces of radio equipment were discovered, along with a directional antenna suspended from the ceiling, and other evidence.

Pressler then operated the suspect's equipment as FCC engineers Barry Peahota and Frank Hurst made recordings of the signal, for later signal and voice print analysis comparison with taped jamming transmissions.

Included among the equipment confiscated were two hand-held transceivers, as well as several scanners, most of which were in operation at the time of the search.

At presstime, no charges had yet been filed against Woods.

ARRL Letter Volume 9 Number 24 November 29, 1990 - Page 2 of 5

HAMS HELP TRACK ANOTHER ALLEGED JAMMER

Another alleged radio jammer has been silenced due in part to the efforts of Amateur Radio operators. On November 6 U.S. marshals and engineers from the FCC's Langhorne, PA field office seized radio equipment, belonging to Ernest Woods, 30, of Norristown, believed to have been used to interfere with Philadelphia-area 2-meter Amateur repeaters, as well as frequencies of the Pennsylvania State Police, the Norristown fire department, and other public service agencies.

Woods could face serious civil and criminal charges as a result. Woods was issued Novice class amateur license KA3WHZ in May 1990 and a Technician license in August.

In late June users of the Telford (PA) Area Repeater Association (TARA) began to experience "persistent and purposeful interference" to their 145.190 MHz repeater. In early August the TARA executive committee and TARA's control operators met to discuss the situation, after the jammer had gotten access, apparently through trial and error, to the repeater's phone patch and speed dial codes.

Concerned for the integrity of the repeater's emergency service codes, TARA on August 8 changed these services to "controlled access," and at the same time began efforts to pinpoint the source of the interfering signal. Standard Amateur fox-hunting techniques soon narrowed the source of the signal to a neighborhood of Norristown, about 20 miles from downtown Philadelphia.

On August 27 a preliminary formal complaint--with tape recordings--was filed by TARA's president with the Engineer in Charge of the FCC field office in Langhorne, PA. Area ARRL and repeater officials were at that time notified of the situation.

On September 2, a team once again tracked "Barney," as they called the jammer, and concluded that additional equipment would be needed to positively identify the specific house from which the signal was being transmitted.

On September 6 a TARA official and one from the Fairview Village 2-meter repeater joined forces, using a Doppler Systems direction finding unit to localize the source of the signal to the same area.

Four days later, a station wss copied interfering with several Pennsylvania State Police channels in the 159-MHz range. A TARA official monitored the police frequencies long enough to confirm to his satisfaction that the interfering operator probably was the TARA repeater jammer.

TARA informed the Pennsylvania State Police of their on- going search for their repeater jammer, and were told the cops had been forced to move to alternate frequencies because of the jammer.

As word spread through various agencies, interference to the state police continued, with Barney telling the troopers to "drop dead" and at one point making a false report of an accident.

By Sept. 12 the FCC had stepped in, to act on complaints both from TARA and from the state police. Engineer-in-Charge John Rahtes asked for TARA's assistance: Rahtes needed a safe house in the immediate neighborhood where his agency could set up equipment to monitor the jammer, identify him, and gather legal evidence.

A vacant third floor apartment was located a half-block from the suspected source of the signal and the FCC installed its equipment, including gear capable of identifying transmitters by their signal signatures. TARA personnel assisted the FCC in monitoring over the next few weeks.

. . . . Continued next part

MEMBERS CHOOSE NEW DIRECTORS

ARRL members in the Northwestern and West Gulf Divisions have voted to send new representatives to the ARRL Board, and in the Hudson Division have returned the incumbent to office for another term. Ballots in these and two other contested elections for 1991-1992 terms of office were counted by the Committee of Tellers November 20 at League Headquarters.

The Northwestern Division race was between Mary Lewis, W7QGP, the present ARRL Section Manager of Western Washington and a past Director of the Divison, and incumbent Bill Shrader, W7QMU. Shrader advanced from the position of Vice Director to Director a year ago following the resignation of Rush Drake, W7RM, for health reasons. Lewis was elected by a margin of 110 votes, 2,382 to 2,272. The incumbent Vice Director, Mary Lou Brown, NM7N, was unopposed for reelection.

In the West Gulf Division, the incumbent Director, Sam Sitton, KV5X, had moved up to that position from Vice Director in January following the election of Jim Haynie, WB5JBP, as an ARRL Vice President. Tom Comstock, N5TC, a past Vice Director, had been appointed to fill the Vice Director vacancy. For the new term, however, Sitton decided to run for Vice Director and was elected without opposition. Comstock ran for Director and was elected over Rik Albury, W5SOQ, by a margin of 2,641 to 1,234.

In the Hudson Division, Director Steve Mendelsohn, WA2DHF, was returned for a third term. In a replay of the 1988 election, Mendelsohn bested Vincent Biancomano, WB2EZG, 2,898 to 1,235. Vice Director Paul Vydareny, WB2VUK, was unopposed for reelection.

The other contests this year were for the Vice Director positions in the Rocky Mountain and Central Divisions.

In the Rocky Mountain Vice Director contest, where the incumbent was not seeking reelection, Bob Scupp, WB5YYX, defeated past Director Lys Carey, K0PGM, by the narrowest margin of the year: 948 to 925. Director Marshall Quiat, AG0X, was reelected without opposition.

In the Central Division, in the only three-way race of the year, incumbent Vice Director Howie Huntington, K9KM, defeated challengers Mike Hoshiko, W9CJW, and Ken Ebneter, K9EN. The three received 2,231, 1,065, and 928 votes respectively. Director Ed Metzger, W9PRN, previously had been declared reelected as the only eligible candidate.

The newly elected League officials take office at noon January 1, 1991, along with the Directors and Vice Directors previously declared elected without opposition in the New England, Roanoke, and Southwestern Divisions.

W1AW TO SHIFT 15 AND 10 M CW FREQUENCIES

Effective January 2, 1991, W1AW will transmit its code practice and CW bulletins on new frequencies in the 15 and 10 meter bands. The change is being made to avoid interference between W1AW and AMTOR operations, which have become very popular near the old frequencies that had been used by W1AW for many years.

The new frequencies will be 21.0675 and 28.0675 MHz, 10 kHz lower than the old frequencies.

DECEMBER 26, 1990
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

In talking or writing about solar acitivity in a given month, we tend to pay more attention to the highs than to the lows, but if the solar flux finishes December at or near the present level, the low will be worth some attention. As of December 26 the minimum solar flux this month was 176, and that came on 1 December. Drop that first day and the December minimum so far would be 182, an exceptionally high figure.

Good winter conditions are also shown in the WWV A index. Through December 26, the A index high was 16, a moderate level. Only three 16s appear in the December reccord, and most A indices are much lower.

The apppearance of the Sun in recent days has shown little change through the afternoon of December 26, but the minor changes seen in both the solar surface and day to day radio propagation suggest that major changes are not far off. A special bulletin will be issued before December 31 if expectional conditions warrant.

American sunspot numbers for December 6 through 12 were 136, 172, 155, 166, 156, 135 and 110 respectively, with a mean figure of 147.1. For the week of December 13 through 19 they were 131, 113, 88, 109, 129, 155 and 150, with a mean figure of 125.

DX BULLETIN 51 ARLD051
FROM ARRL HEADQUARTERS NEWINGTON CT
DECEMBER 28, 1990
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

Thanks to Allen, N2KW, The TRISTATE DX PacketCluster Network, and the many others who made these DX Bulletins possible during 1990.

AFGHANISTAN. UT5RP has volunteered to assist YA0RR QSL duties. Dima says Romeo will operate for a three week period in January. Stateside coordinator NT2X is less optimistic, citing numerous obstacles to an early starting date.

ANGOLA. An Argentine group has targeted D2 for activation next

Spring.

CHATHAM ISLAND. ZL0AAD/7 is on 7 MHz CW at 1200 UTC and ZL0ADN/7 is on 14 MHz SSB at 1100 UTC as well as other times. They will be active one more week. QSL to DJ1ND. ZL0AIC is in Antarctica and QSLs via HB9AAA.

CHRISTMAS ISLAND. A Japanese group plans an operation April 2 through 9.

COMOROS. D68JM likes 14 MHz SSB at 0400 UTC. QSL via WV4F.

FAROES. OY9JD has a good signal on 3799 KHz at 2130 UTC. Jon also likes 28 MHz SSB in the morning while OY1CT keeps the CW crowd happy.

FRANZ JOSEPH LAND. Now is the time of year to log this northern outpost as volleyball has been suspended for the winter. 4K2OIL with a strapping 17 meter signal, 4K2PGO and 4K2BDU on 20 meters, and 4K2PYL on 40 meters, all combine to make FJL available around the clock.

JAN MAYEN. JX7DFA has been active on 28 MHz RTTY at 1300 UTC and CW a bit later.

LEBANON. OD5SK and OD5RH both like 28 MHz SSB after 1400 UTC.

LESOTHO. 7P8CI and 7P8EB can be found on 10, 15 or 17 meter SSB most days after 1900 UTC.

MALAWI. 7Q7LA works 18 MHz CW at 1600 and 1900 UTC, and 14 MHz CW at 0430 UTC. QSL via G0IAS.

OMAN. A41KY and A47RS have been active on 28 MHz SSB at 1300 UTC. A41JZ prefers 7 MHz CW at 0300 UTC.

PAKISTAN. AP5HQ has a great signal on 14183 KHz at 0230 UTC. QSL via N0RR. Lets hope these conditions hold for the YA0RR operation.

QATAR. Both A71AL and A71CD like 28 MHz SSB at 1300 UTC.

RWANDA. 9X5SW visits the Brazil DX Net on Saturdays at 1300 UTC on 28533 KHz. QSL to DL1HH.

SAN FELIX. XQ0X has been very busy this week. All operations have been 14 and 28 MHz SSB. If you need this one, work him now before his work schedule expands. See NOTE 1.

SINGAPORE. 9V1XQ has a commanding signal on 14180 KHz after 2200 UTC. QSL via K2QBV.

SOUTH ORKNEY. VP8BXK visits various 20 meter nets as time permits. A Spanish scientific team will visit South Orkney and South Shetland during January. QSL ED0BOD and EG0BOD via EA4BOD.

SOUTH SHETLAND. 4K1ADQ joins HF0POL around February 1 in keeping this outpost very active.

TAIWAN. BV2FB likes 14 MHz SSB at 2330 UTC. QSL via AA6BB. BV2TA has a good signal on 7 MHz CW at 1230 UTC.

VANUATU. YJ8RN likes 14 MHz SSB at 0630 UTC. QSL to N9DRU.

ZAIRE. 9Q5TE is back from his SM holiday. Gus has an outstanding signal on 14 MHz SSB at 0500 UTC. 9Q5AA prefers 28 MHz SSB at 2300 UTC.

NOTE 1. XQ0X manager CE3ESS requests QSLs be sent to Box 9834, Santiago, Chile. Please send them after January 15.

NOTE 2. During 1990 the combined YCCC/TRISTATE PacketCluster Network logged over 300 countries. Among the 35,000 spots were 179 countries on top-band.

NOTE 3. UH8EA is workable on 3501 KHz at 0230 UTC. 3C1EA likes the same frequency. Add K1EA calling and things get very confusing.

NOTE 4. The NCDXC weekly bulletin is an excellent source of fresh information. Listen for W6TI on 14002 KHz at 0200 UTC each Monday.

NOTE 5. 9K2CS is back on the air operating portable in HZ awaiting his license. Please do not ask him about 7O1AA QSLs. The logs are in Kuwait and no QLSing is possible yet. Mohamed would like to attend the 1991 Dayton Hamvention.

NOTE 6. This bulletin marks the last in a series by N2KW who will be vacationing in Orlando, Florida, this winter. Allen regrets that being unable to log on to the TRISTATE node of K2GX will preclude further bulletins from him until later next Spring. Give him a call if you hear his mobile signal.

Good Luck on DX de KB8NW/OBS

Someone asked how to modify their Radio Shack PRO-2006 Scanner to receive the blocked frequencies. Here's how.

Basically, what you will be doing is disconnecting diode D502. That's all.

1. Unplug the scanner from it's power source and remove the antenna(s).

2. Unscrew and remove the four phillip screws on the back panel of the scanner that hold the top and bottom half of the scanner's plastic case. No need to unscrew any of the other screws, just the top two and the bottom two.

3. Carefully remove the two halves of the scanner's plastic case by first pulling the case away from the front panel and then out. The top half of the plastic case has the speaker permanently attached to it with a wire connecting it to the top circuit board, so be sure to unplug the wire from the circuit board before you yank it off when you remove the case.

4. Diode D502, your target, is now in view. You will see it on the back of the circuit board behind the top right corner of the front panel (looking at it from the front). The diode is standing upright from the circuit board, so you're job of snipping it is made somewhat easier.

   The diode is the second one from the top. The designator "D502" is printed in white on the circuit board at the foot of the diode. All you need to do is snip the wire that connects to the diode so as to disconnect it from the circuit. No need to remove the diode entirely, just cut the wire into it. If you don't have the proper tool to cut it, finger nail clippers will do the job beautifully. It maybe necessary to unscrew the front panel from the frame if there's not enough room for you to get at the diode. Just remember not to yank too hard when pulling the panel from the frame since the LED display, keypad, and other controls are still plugged into the circuit board. It really isn't necessary to unplug all these things, just move the panel slightly away; enough to give you room.

5. After disconnecting the diode, put everything back together the same way you took it apart (Did I really need to say that? :)

Your PRO-2006 scanner is now able to receive the previously blocked out frequencies of 823.945 MHz to 851 MHz, and 868.945 MHz to 896 MHz. It can now also step in 30 kHz increments in addition to 5 kHz, 12.5 kHz, and 50 kHz. You will notice 30 kHz in the LED display when you scan your new frequencies, unless of course you pressed the STEP button to change it. Once you press STEP, you will not be able to reselect 30 kHz again unless you reprogram.

And so endeth a layman's guide for modding the PRO-2006.

In article <1990Dec27.175211@suisse.enet.dec.com> d_muller@suisse.enet.dec.com (Dan Muller) writes:

> I have a question regarding QSL cards. I'm a raw beginner, and I've only had two QSOs so far. One of them was in Lithuania, so I'm anxious to send a QSL card to make sure that I get one back. However, I don't have any QSL cards yet. I have access to laser printers and software that would allow me to make my own QSL card layouts. Since I'm not sure how long I'll have my Novice call (I want to upgrade soon), I'm reluctant to buy a lot of 500 cards. Would it be considered bad form (no pun intended) to print some QSL cards on regular paper, cut them out, and send them, rather than having them printed professionally on heavy stock?

As a sorter for the W1 Call Area, I would have to say that ANY piece of paper with the right information on it is good. Minimum information would be your callsign, his (or her) callsign (BLOCK LETTERS ARE BEST and make it clear WHICH CALLSIGN IT'S GOING TO), signal report, date, time in UTC and frequency, plus mode (CW, SSB, etc) if you intend to later use it for specialty certificates.

As a favor to the other station, I'd probably put his first name and qth in (especially if you send it thru the bureau. we can sometime figure out the real callsign by looking in the Callbooks and looking at the name and qth even when the callsign is questionable), as well as your own name and address and your county, if you know what it is (many foreigners collect "all county" qsl cards).

Another "it would be nice". Make the piece of paper approximately the size of a normal QSL card (3 1/2 x 5 1/2). They're easier to sort that way.

I got a real neat one a few days ago.....The QSL card was coming from Italy....going to USSR......it made a stop at my house along the way :-).

CHEERS!

Michael Waugh writes:
>>I'm interested in the No code Tech class of ham licence.

>>What would be a good book to study, that would cover the

>>requirements for the written test.

The new Tech test will consist of the old Novice theory test,
plus the old 25 question Tech test. There are a number of
good books you can use, I recommend the following:
for Novice, the Ameco Amateur Radio Novice Class Theory Course.
    Cat num. 23-01.
for Tech, the ARRL Tech theory book, I don't remember the exact
title.
Both of these books give you more information than you need to
pass the tests. In addition, the ARRL book gives you the
entire 250 question pool from which the test will be taken from.
(That is one deficiency in the Ameco book, it doesn't have the
questions in it. Another good book, ARRL's Tune in the World With
Ham Radio, does have the entire 300 question novice pool.)

Make sure you get the latest version of any book. These can be
purchased from any radio store, and the ARRL books can, I believe,
be purchased directly from the ARRL.

If you have a Mac computer, someone on the net has typed the entire
question pools into Hypercard, so that may help you if you get
that.

Hope that helped, good luck.

Who you polling, Paul? It would be nice to see how may Hams want to do away
with the theory exams, but it's my opinion that these are not the people who
would like to do away with the exams. You need to poll the folks out there
who don't have tickets and who may claim that the only thing that's been
keeping them from getting one is the @@$%&* theory exams.

(-: (-:   Tongue firmly implanted in cheek :-) :-)

No-study degrees (a.k.a. athletic scholarships) establish a strong
precedent. Any lawyer could probably "prove" that the theory
questions are culturally biased.

Just mark the appropriate space on next year's IRS Form 1040:

Do you want to be a ham? Yes___ No___

Organization: ---
Lines: 64

Intermingled with the messages pertaining to the continuing code/
no-code debate have been repeated references to what is going on

at 14313 kHz. At least two messages on Usenet expressed curiousity about 14313, and I've been wondering about that frequency myself, so I tuned it in today on my Sony ICF-2010.

I realize that many hams have listened to this first-hand. For the benefit of those who haven't, however, this is what I found when I turned on the radio today on 23 December 1990, beginning at 2045 UTC:

```
Time:   Description:
--------------------
2045*   "You are a <homosexual epithet>" (no call sign, repeated
          several times)
2050*   "Is this frequency in use, pleeeeeeeez?" (no call sign,
          repeated several times)
2057    "Bearcat 1 to Bearcat 2" (again, no call sign)
2058    DELIBERATE ATTEMPT TO JAM A LEGITIMATE QSO IN PROGRESS:
          "Get off the air, <actual callsign>.  Who the h*** do
          you think you are?"
2059    "<Actual callsign> dog****, get off the frequency."
2101    Anti-semetic epithets heard at this time
2102    Morse code (jamming?).  Also, someone is whistling into the
          microphone.
2106    More epithets heard.
2108    Deliberate interference by moving microphone or breathing
          into it.
2116    Deliberate jamming by chanting/singing into the
          microphone.
2124    "Who gives a ****" (no call sign, regular intervals)
2128    Computer tones (AMTOR?) heard
2129    First reference to Herbie heard.  More epithets heard.
2135    Best wishes and a Happy New Year (from someone who had
          previously given his callsign).  8-)
```

(* Approximate time.)

As I type this, I've been looking at my copy of "Tune in the World", and I may yet learn the code and get licensed in the traditional way. But having said that, let me add this:

1) I have no problem with someone coming into Ham Radio through the most recently developed route (i.e., the no-code Tech). I wish these people the best of luck.

2) In no way does 14313 represent typical ham behavior. I have yet to hear another frequency that sounds even remotely like the one I had described above.

3) The presence or absence of the knowledge of morse code is not a prerequisite for acting like an idiot on the air. Given the behavior on 14313, I don't think we have any right to claim that the no-code license holders will contribute to the deterioration of ham radio. For as far as I can tell, at least as far as 14313 is concerned, that's happening already.

Best wishes for the holiday season.

```
Sander J. Rabinowitz     | sjr@mcimail.com -or- | ARRL Associate Member
Farmington Hills, Mich.  | !sander@attmail.com  |         8-)
```

P.S. IMHO, only two or three stations were responsible for the mess
I described above.

You can reduce the carrier level during quiet periods to accomplish the same thing with AM. National Semiconductor used to have a modulator circuit in their Linear Applications Handbook that worked this way. (I don't remember whether it was a switching or linear modulator.)

>
>The AM signal will suffer a 3 db penalty due to the wider receiver bandwidth
>allowing in twice as much noise energy. This doesn't even consider

You're right about this...

>the fact that an AM envelope detector throws away another 3 db compared to
>the product detector used for SSB.

...but the final S/N ratio is determined by the front end and IF filters, pretty much independent of the detection scheme if we are above threshold.

>However, if you use a coherent synchronous
>dectector and DSB suppressed carrier, you get a big win in signal to noise
>ratio. Noise is non-coherent and is strongly rejected by a coherent detector.
>As much as 12 db improvement over an equal power SSB signal is possible.
>About the only disadvantages of using DSB suppressed carrier with coherent
>detection are an increased susceptibility to selective fading and, of course,
>the consumption of twice the spectrum of SSB. With today's ICs it's relatively

>easy to build a top notch coherent DSB system.

Consideration of SNR as a function of DC input is pretty much an obsolete
concept unless there are stringent heat dissipation considerations, like for
example a "cubic incher" type transmitter. You have the choice of throwing
half your power away as heat or throwing half your power away as useless
carrier. If we had an 80 or 90 percent efficient SSB transmitter (maybe with
some sort of high level modulator) it would be another story. Any ideas?

OK folks, let's make an organized effort to do some direction finding
on 14313. If people would compile logs like you just did -- with the
beam heading for each signal and the approximate signal strength --
then it would be fairly easy for the Official Observers (chez ARRL)
to "reduce the observations" into some quite clean data about who the
obnoxious operators are.

I don't have a rotatable antenna, so there's not much I can do, but
all the people with directional antennas could accomplish a lot.

This is similar to observational astronomy projects I've been involved
with, such as locating meteorites. A large number of relatively
unsophisticated observations can be very valuable. Exact times are needed.

      On Decemer 13th, the FCC modified the requirements for the Technician
Class license with a code test. This bold move offers great hope to all of us
```

who are deeply concerned with the possibility that amateur radio will one day soon be crushed under the weight of the spectrum needs of other services.

I was disturbed to note, however, that you were reported to be considering asking the FCC to reconsider this action to the extent of confining the new codeless Technicians to 222 mhz and up. I consider this most unwise for the following reasons:

One basic Technician Class license with one written exam + a CW endorsement for those who want to operate on HF would be easier and cheaper for the FCC to administer.

"Ghetto-izing" the codefree Technician Class licensees provides no regulatory or technological benefit. Rather, it serves only to codify social discrimination by preventing the newcomers from coming into contact with the majority of their fellow amateur operators.

Amateur radio constitutes the United States' first National Park of the Mind, and broad, open access to that public resource will provide intellectually stimulating and spiritually refreshing benefits to the nation that narrow, inhibitory access by the privileged few cannot. I believe that that is the basic reason the FCC made its decision.

Amateur radio's greatest contributions to the state of the art occurred during the period of its early history when it was not straight-jacketed by complex regulations and licensing structures not based on compelling need. Preventing or inhibiting the freest possible exploration of the National Park of the Mind consistent with conserving its meaningful existence would tend toward reducing it to the site for historical tableaux similar to those re-enactments of medieval jousting.

There is no compelling need for creating your proposed codefree ghetto. Therefore, any request for reconsideration will doubtlessly be rejected out of hand. The only result of a Petition for Reconsideration will be to make the League look foolish.

Moreover, since the new codefree amateurs are going to revitalize the future of ham radio, resentment against the organization that attempted to cause part of the original promise to be withdrawn would no doubt result in very few of them joining the League, which would very likely become little more than the custodians for its Antique Wireless Museum.

To summarize, it's a dumb idea.

SB ALL @ AMSAT $ANS-349.01
SAREX RELATED QRM INQUIRY

HR AMSAT NEWS SERVICE BULLETIN 349.01 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

Information Needed On SAREX QRMing Of Terrestrial Operations on 144.950 MHz

After a highly successful Shuttle Amateur Radio Experiment (SAREX) on the recent STS-35 ASTRO-1 mission, AMSAT-NA officials would like to assess the effect this SAREX mission had on the users of packet radio DX clusters and other services which use 144.950 MHz. During the flight of STS-35, WA4SIR's packet station was set up to operate on the 2M split-frequency combination of 145.550/144.950 MHz. This frequency arrangement was choosen so that those with simple 2 meter FM packet stations with only 600 KHz split option would still have a chance to make a contact and receive a QSL card from WA4SIR. At the final "tally," this strategy seemed to have worked well as over 1800 stations had made packet contact with WA4SIR.

But before the flight of STS-35 began, AMSAT-NA and ARRL officials became aware of numerous protests in the amateur radio community to the use of 144.950 MHz for the uplink to SAREX. Subsequently, a set of guidelines and suggested operating procedures were drawn up and published in the AMSAT News Service (ANS) bulletins to help reduce the QRM on 144.950 MHz when STS-35 was overhead. Now Doug Loughmiller (KO5I), AMSAT-NA President and General Manager would like to hear from the "Sys Ops," users of packet DX clusters, and other 144.950 occupants about any QRM problems they faced during the nine day SAREX mission and how well the AMSAT guidelines were followed. Please send your comments and observations to:

Doug Loughmiller, KO5I
AMSAT-NA President & GM

MIR OPERATIONS UPDATE

HR AMSAT NEWS SERVICE BULLETIN 349.02 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

Off to a Slow Start, but Expectations are High

Amateur Radio Operation from the Soviet Space Station MIR has been erratic since Musa, U2MIR, has been extremely busy tending to his duties aboard MIR. During a QSO with Hans, ZS6AKV, Musa apologized that he was very busy and didn't have much time for Amateur Radio right now. Musa did say that packet operation should commence soon after the launch of the Progress-M6 supply ship which will transport the packet experiment equipment. Progress is due for liftoff on 15 Jan from Baikonur and slated for docking on 17 Jan. Any slip in the launch of Progress will obviously delay the commencement of packet operations. It is expected that it will take a few days for Musa to complete the integration of the packet experiment with the existing 2 meter FM transceiver onboard.

Hopes for an expected QSO between Musa in MIR and Ron Parise in Columbia were dashed when the Shuttle orbiter was brought home a full day earlier than scheduled due to landing strip weather constraints. It is unclear at this time whether Musa will still be on MIR when the STS-37 Mission and its crew of FIVE Amateur Radio operators, who also happen to be astronauts, will be launched. The STS-37 launch is scheduled for the spring of 1991.

[ANS thanks Ed O'Grady, KE2VC, and Hans ZS6AKV for the information for this Bulletin]

STS-35 SAREX A MAJOR SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 349.03 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

STS-35 SAREX Mission A Major Success; STS-37 To Carry Five Hams In May '91

Less than a week after the STS-35 SAREX mission AMSAT-NA officials are declaring the SAREX portion of the flight to be a major success. Over 1800 radio amateurs around the world were able to make a packet radio contact with WA4SIR. In addition to the fun generated by a "space-mobile" station, hundreds of elementry school children were thrilled by the chance to talk with Ron Parise and ask questions about life in space through amateur radio relay stations in Australia and Brazil. For those who made a contact with WA4SIR and would like to receive a beautiful QSL card, send your QSL to ARRL HQ (225 Main Street, Newington, Ct, 06111) along with an S.A.S.E, ATTENTION: Education Activities Dept., and you will have a return QSL card on the way to you soon. Once the log of contacts has been retrieved by Johnson Space Center Amateur Radio Club (JSC ARC), the complete list of calls from the SAREX mission will be re-printed in the AMSAT Journal.

On the next scientific shuttle mission, STS-37, there will be FIVE licensed amateur operators aboard; the ENTIRE shuttle crew for this flight are hams! They are: Ken Cameron (KB5AWP), Jay Apt (N5QWL), Lynda Godwin (N5RAX), Steve Nagel (N5RAW), and Jerry Ross who recently passed his Novice exam but has not yet received his call. This SAREX mission will have an upgraded station which should include fast-scan ATV. ATV enthusiasts can look forward to uplinking their famous "ham-station" pictures to this flying "hamvention." Look for further information from the AMSAT News Service (ANS) as more information becomes available about STS-37.

MIICROSAT UPDATE

HR AMSAT NEWS SERVICE BULLETIN 349.04 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

AMSAT Engineering Team issues Microsat Status dated 12/14/90

Not much happened this week, as business commitments (real jobs!) and Christmas shopping cut into the Microsat staff's available work hours. Several microsat controllers were away on trips; the spacecraft were being monitored properly, but the redundancy we like to have when uploading new software was not available.

All four spacecraft are in a stable condition, sending PHT telemetry. LO-19 and AO-16 are available for digipeating, and the WEBERSAT crew continues to experiment with attitude determination methods and iris settings. Several new test images are downlinked each week.

WO-18 seems to have at least two different stable spin modes, although the exact mechanism for changing from one to the other remains unclear. In the last several weeks, it has gone to a much slower spin rate than the rate it was spinning immediately after launch. This has reduced the number of times each day that the geometry between the camera and the earth is optimum for imaging. Part of the problem is in determining how to tell (using the horizon sensor and array currents) when the geometry IS right.

The AO-16 power management problem that cropped up early last week has been resolved, and the spacecraft is happily running its new algorithm.

The problems that took the AO-16 BBS out of service two weeks ago have been identified. Jeff Ward at Surrey has made some fixes and implemented the "last" major feature, UO-14 has been reloaded and is being tested. Harold Price is fixing a problem with the AX.25 driver, and will reload AO-16 shortly.

Jeff Ward and Harold Price, the BBS developers, ask that users who are writing their own FTL0 interface programs refrain from mass distribution of those programs to others until they certify that the spacecraft software is ready. The easiest way to control access to the flight BBS during this last test phase is to have a small set of beta testers. You should feel free to continue your own testing with the live spacecraft, and report any problems you encounter. You will be able to release your software at the same time we release the spacecraft for general use. The current plan calls for this to occur around Dec 25. Merry Christmas!

[ANS thanks Harold Price, NK6K, for the information for this bulletin]

WEBERSAT-OSCAR-18 UPDATE

HR AMSAT NEWS SERVICE BULLETIN 349.05 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

WEBERSAT-OSCAR-18 (WO-18) Update From Weber State University: December 7, 1990

In the past week, a few new things have been learned about the performance of WO-18. First and foremost, the present rotation of the spacecraft about its Z-axis is one revolution approximately every 21 minutes. This is a drastically slower rate than what was expected before launch. There is as yet no explanation of why the rotation slowed from its immediate post-launch value of one revolution-per-minute (1 RPM). We are not convinced the present rate will be the final rotation profile of the spacecraft. Evidence is accumulating that a future reversal of rotation direction is not likely, i.e., the rotation rate is not slowing linearly. In fact, there has been little change in the Z-axis rotation rate in the last two weeks.

Despite the decreased rotation and its negative impact on low latitude photo opportunities, we have continued to attempt experiments with varied iris parameters during earth imaging. On a daily basis, we typically attempt about 6 to 7 photos (the number of equator crossings between day and night passes at WSU) of the Earth with different parameter adjustments.

Listeners in the U.S. may often hear transitions from one transmitted photo to the next as we examine the results of each experiment. When interesting photos are obtained, we will notify the user community through the usual media and leave that photo transmitting from WO-18 for several days.

We are continuing to process standard TLM and Whole Orbit Data (WOD) for a complete archive file. Reid Bristor is sending his AMSAT archived data to add to ours. We have added features to our decode program that provides plotting capability. If WO-18 users are interested in this program and other software we are working on in data analysis, we could spend some effort making these tools more user friendly and distribute them to users through the AMSAT-NA Software Exchange.

FCC CODELESS LICENSE ACTION

HR AMSAT NEWS SERVICE BULLETIN 349.06 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

Morse Code Requirement Removed from FCC Technician Class Amateur License

In an action by the FCC on December 13, 1990, the Morse Code testing requirement for the Technician class amateur license was removed. This change in requirement could take effect as soon as February 1991.

Those obtaining Technician licenses after the rules change will have full amateur privileges above 30 MHz but will not be allowed to use the Novice/Technician allocations below 30 MHz unless they pass the 5 WPM code test now required of both Novices and Technicians. There will be no special callsign groups or other distinction between Technicians licensed for operation below 30 MHz and those "code free" Technicians restricted to VHF and above aside from FCC and VEC records.

The Novice license is unaffected by this action and existing Technician licensees will be "grandfathered" into the new system. The codeless Technician written examination will have 55 questions.

AMSAT, under the leadership of its Board of Directors, has been a supporter of the no-code concept although this ruling is somewhat different from the proposal and comments submitted officially by AMSAT. Many active satellite operators from Europe, Australia, and other countries are holders of no-code licenses similar to the type soon to become available in the U.S. due to this action. It is AMSAT's hope and desire that many new licensees who have previously found the universal Morse code requirement unsuited to their needs and tastes will be brought into the Amateur Radio Service and that many of these will be attracted into the Radio Amateur Satellite Service by the interesting technical and operational challenges inherent in our type of activity.

[ANS thanks W4RI and the ARRL for the information in this bulletin.]

ZRO TEST SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 349.07 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

Schedule of ZRO Tests, Fall Edition

The following schedule of Mode "B" and "JL" ZRO tests were chosen for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" test on 435.945 MHz.:

Saturday December 22, 1990 at 0530 UTC "B"
Saturday December 22, 1990 at 0645 UTC "JL"

Note that the dates and times are noted in "UTC." The tests on December 22nd occur late Friday night for those in North America. Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets as well as ANS. Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure describes test procedures and means for obtaining certificates and gives some historical background about the program.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception. Good luck!

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 349.08 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times.Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date	Phs	mode	UTC	NCS	Alt.	U.S. day
29 Dec 90	206	B	1500	KA5SMA	WB9ANQ	Saturday
05 Jan 91	214	B	1900	WD0E	WA5ZIB	Saturday
13 Jan 91	99	B	0500	WB6LLO	N5BF	Saturday
19 Jan 91	210	B	1445	WB9ANQ	KA5SMA	Saturday
26 Jan 91	211	B	1830	WA5ZIB	WD0E	Saturday

Jim White (WD0E) is scheduled to discuss Pacsat file server ground software operation with the net on 29 December 90. He and others on the pacsat test team will be available on nets through the Pacsat operational release period to assist new users.

John Champa (K8OCL), AMSAT-NA Executive VP will discuss AMSAT participation in advanced projects such as the World Space Foundation Solar Sail, Lunar Polar Prospector, and SEDSAT (supported by the Detroit Oscar User's Group) during the net session on 13 January 91.

Roy Welch (W0SL) will discuss his new job as AMSAT Software Exchange Manager and what this means in terms of improved software user support during the 26 January 91 session.

It is the intention of the Operations Net management to have guest speakers approximately every other week to provide up-to-the-minute information on topics of interest (such as Microsat ground station software, AMSAT Software Exchange,and WARC 92). As guest speakers and topics are confirmed they will be published in ANS.

Nets are scheduled for North American geographic coverage and time zones although other parts of the world are often within the footprint and check-ins from everywhere are welcome. Those who don't have adequate and convenient coverage from this net are encouraged to schedule their own nets via AO-13. Consider moving some of your HF AMSAT Net sessions to the satellite or retransmitting nets from one to the other! Write to AMSAT Headquarters or send a note to N5BF @ WB6YMH with your schedule to have it included in ANS.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

SB ALL @ AMSAT $ANS-349.09
FALL AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 349.09 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 15, 1990
TO ALL RADIO AMATEURS BT

The transponder schedule for AO-13 is as follows:

Mode-B : MA 000 to MA 095
Mode-JL: MA 095 to MA 125
Mode-LS: MA 125 to MA 130
Mode-S : MA 130 to MA 135
Mode-BS: MA 135 to MA 140 <--- QRP on Mode B Please
Mode-B : MA 140 to MA 256
Omnis : MA 232 to MA 040

This schedule is expected to continue through 26 Dec 90.

Magnetorquing operation is expected to take place the week of 24 Dec 90. This operation takes place during the portion of the orbit closest to perigee (MA 000) and is done primarily to reorient the spacecraft for improved solar panel illumination. During magnetorquing, the transponders will be off (typically between MA 220 and MA 60. Once magnetorquing has been completed, a new Transponder Schedule will be published by the AO-13 Command Station Team and it will be published here in ANS.

The command team requests that you make a specific effort to use QRP on Mode B between MA 135 to 140. This is specifically to help those people experimenting with Mode S. (Although you really should always keep checking that your peak signal is never stronger than the beacon (145.813/435.651 MHz)

The spacecraft attitude of AO-13 is calculated to be:

BLON = 179.7 and BLAT = -3.3 for 17 December 90

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations. The transponder may be used, carefully, at all points of the orbit except MA 254 - 006 when eclipses occur. If beacon or transponder signals show signs of FMing, users should cease all transponder use immediately. An APPROXIMATION of the spacecraft attitude for AO-10 is :

BLON = 4.0   and BLAT = 0.0 for 15 December 90

/EX

MONDAY DECEMBER 24, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.

It is published every week and is made available for unlimited distribution.

* MIR NEWS *

U2MIR has once again become active from the Mir space station complex. Musa Manarov, the Amateur Radio operator presently on board Mir has been quite busy with his activities on the space station, so he hasn't had much time to make many radio contacts. Packet radio operations are expected to commence soon after Progress-M6 carries a packet radio TNC to Mir. The launch of Progress-M6 is expected on 15-Jan-91, and docking will occur with Mir on 17-Jan-91.

* DOVE NEWS *

DOVE-1/OSCAR-17 still has not been reloaded with new software. After the holidays, it is hoped that DOVE will be reset and reloaded with new operating software that will allow the spacecraft to transmit messages consisting of digitized speech.

* TNX QSL! *

A special thanks to all those who sent QSLs, cards and letters to SpaceNews:

UO-14 UPDATE

HR AMSAT NEWS SERVICE BULLETIN 356.01 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 22, 1990
TO ALL RADIO AMATEURS BT

UoSAT-OSCAR-14 File Server Available for Access

After final testing of groundstation and spacecraft software by the beta testers, the UO-14 File Server 'PBBS' is been released for general access. Any suitably equipped stations are welcome to use the system. The UO-14 Engineering Team encourages users to report their early experiences of UO-14 BBS operations. They are particularly interested in hearing how you have connected 9600 baud FSK modems to various radios.

UO-14 is currently broadcasting a file containing groundstation client software for IBM-PC compatible computers; users who are already receiving the PACSAT Broadcast Protocol transmissions can 'bootstrap' themselves simply by receiving this broadcast. The file, number 791, is a .ZIP file containing PG.EXE and associated documentation. This file will also be posted on Compuserve and will migrate to other information sources. If you are not already using the PACSAT Broadcast Protocol, make sure to get the PACSAT File Header utility programs PFHADD.EXE and PHS.EXE as well as PG.EXE. The G0/K8KA groundstation software works on both AO-16 and UO-14. As updated versions of the PACSAT Protocol Suite are released, they will be carried as files on the satellites themselves in the same way that file 791 is carried now. The AMSAT Software Exchange is making copies available of this and other PACSAT related software via AMSAT Headquarters.

You MUST have proper groundstation software before you can access the UO-14 or AO-16 file servers. The PACSAT Protocol Suite has been specified and widely published. At least two software authors (other than G0/K8KA) have used these specifications and written groundstation client software for the IBM; Implementations for other popular computers should follow in the New Year.

[ANS thanks Jeff W Ward, G0/K8KA for the information for this bulletin]

MICROSAT UPDATE

HR AMSAT NEWS SERVICE BULLETIN 356.02 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 22, 1990
TO ALL RADIO AMATEURS BT

Microsat Engineering Team Status Report as of 12/21/90

SUMMARY:

AO-16 - sending PHT telemetry, file system running for beta test.
DO-17 - sending PHT telemetry, no other changes.
WO-18 - sending PHT telemetry, dark image testing.
LO-19 - sending PHT telemetry, being reloaded.

FILE SYSTEM: We have again loaded what we hope is the final version of the first general release of the file system. UO-14 has also been reloaded. This latest reload was caused by a bug that was added while fixing several other bugs.

Jeff Ward, G0/K8KA, has also made some tweaks to the final version of the general release of PG. It is currently on UO-14, and we'll start it broadcasting from AO-16 this weekend. It will be compressed with ZIP. PB, the broadcast receiver, has been available on CIS for several weeks, and is available on several other BBS systems. The first version of PG was released on CIS and via UO-14 on 12/19/90.

UO-14 has already been released for general access. We want to do one more round of beta-tester access on AO-16 before exposing it to the masses. The previous bug was found quickly because each of the beta testers sent in their PG.LOG file which was matched to the post-mortem dump taken from AO-16. The next target for AO-16 release is Dec 24, provided there are no further problems.

If you get a copy of PG, do not try to use it on AO-16 until you see a specific message announcing that AO-16 is available for general use. You will need a special command in the PG.CFG file to access AO-16 and this command will not be documented until AO-16 is available for general use.

TELEMETRY: The diagnostic "wash" status message has been removed in this upload. The edac error counter now appears in the status message, in status[17]. This status cell was previously unused. We have done this to reduce the overhead on the downlink.

AO-16: The AO-16 BBS was restarted on 21 DEC 90 at 19:14 UTC. At this writing, it has survived three passes over the US with a reasonable load. WD0E, WB9ANQ, N4HY, and NK6K generated 290 activity log entries, activities like logon, logoff, directory, upload, and download. We will continue testing with a limited number of beta users, if all goes well, AO-16 should be open for general use in a few days. The more discriminating users will notice that the AO-16 downlink, when broadcasting, is different than it has been in the past. This version of the BBS uses only one buffer for the broadcast output queue, the previous version used three. That meant that, even during slow operations like an upload file close, when the entire file is scanned and the header checksum is computed, there were enough buffers for the DMA to keep the transmitter busy. With only one buffer, there will be occasional gaps for as much as a few seconds. The number of broadcast buffers may be increased in the next version, this version is an experiment to see how much free memory is available in the minimum configuration. Aside from causing the developer's hearts to miss a beat, the pauses are not a problem.

DO-17: Now that the AO-16 BBS software is stabilizing, attention is turning to DOVE. N4HY is to begin preparing a special loader for DOVE shortly.

WO-18: There have been no operational changes to WO-18 this week. The WEBERSAT command station has been downloading various dark side images this week to gather information on minor CCD defects which can be subtracted from normal images. They are also attempting to see if, with sufficient post-processing, stars can be discerned.

LO-19: LUSAT was reset to the ROM and rebooted early on 22 DEC 90 UTC in preparation for loading the BBS. The BBS code will be loaded from the LUSAT command station in Argentina. There is no announced date for general availability of the LO-19 BBS.

The following recommendations for TNC parameters are made for use with the AO-16 BBS.

Set FRACK to 6. Set MAXFRAME to 1.

These settings are compatible with the multi-user 1200 baud downlink.

ACTIVITY LOG: The following request is made by G0/K8KA for UO-14 and by NK6K for AO-16. Please do not download the activity log files (ALyymmdd). They are very large now, primarily for use in debugging, and several downloads per pass is inefficient. The previous day's AL file will be put in the broadcast rotation. A program to display the file will also be broadcast.

[ANS thanks Harold Price, NK6K, for the information for this bulletin]

BADR DECAYS

HR AMSAT NEWS SERVICE BULLETIN 356.03 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 22, 1990
TO ALL RADIO AMATEURS BT

Pakistani 'Amateur' Satellite Re-enters Earth's Atmosphere.

A Pakistani satellite launched by the People's Republic of China earlier this year re-entered the Earth's Atmosphere either late on 8 December 90 or early on 9 December 90. The satellite, dubbed BADR, had an output frequency of 145.825 MHz, a frequency also used by UO-11 and DO-17. It was never quite understood why the Pakistani Government assigned the 145.825 MHz output frequency when there was no amateur transponder on-board or any published telemetry information which might have been of use to the Amateur Service.

Below is a beginning and ending snapshot of selected orbital paramaters of BADR

AMSAT BEGINNERS WORKSHOP

HR AMSAT NEWS SERVICE BULLETIN 356.04 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 22, 1990
TO ALL RADIO AMATEURS BT

Tyler, TX ARC To Offer Beginner's Workshop On January 19, 1991

The Tyler, TX Amateur Radio Club will present an all day "hands-on" workshop to help acquaint beginners with the operation of all OSCARs flying today. Included in this workshop will be a discussion about Weather Satellites by Dallas Remote Imaging Group (DRIG) Chairman Jeff Walach (N5ITU). In addition to classroom discussions, there will be several OSCAR stations set up to allow as many attendees as possible the chance of using at least one OSCAR during the day. Stations will be available for use with AO-13, PACSATs, RS-10/11, RS-14/RUDAK-2, and for viewing weather satellite pictures.

After the workshop, there will be a dinner banquet with keynote speaker AMSAT-NA President and General Manager, Doug Loughmiller (KO5I). You are invited to join the Tyler ARC on January 19, 1991 at the Tyler, TX Junior College for this excellent event. For more information about registration and lodgings, contact KO5I at (903) 784-3740.

TEXAS BALLOON LAUNCH SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 356.05 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 22, 1990
TO ALL RADIO AMATEURS BT

Texas Balloon Launch Dubbed a Great Success

The Huntsville Municipal Airport served as the setting for the launch of a hot air balloon carring an amateur radio payload at 10:46 local time on December 8, 1990. The launch team was composed entirely of AMSAT Members. The balloon lifted the payload (a two-meter telemetry beacon) to over 100,000 feet. Analog data (tones) for external temperature and altitude were transmitted using CW with the keying speed being set by internal temperature. The 200 mW beacon was placed on 147.435 MHz using the callsign WB5HLZ. External temperatures reached -70 degrees F. Internal temperatures never fell below 34 degrees F. The package transmitted flawlessly for the duration of the flight and was still transmitting 30 hours after launch.

Recovery was at 3:10 PM on December 9th when the package was found at the 70' level of a pine tree in a private game preserve in thick woods near Magnolia, TX. The cord above the package was parted "Texas style" by a .22 caliber bullet just above the swivel joint holding the package in the tree. The parachute was not recovered and the tree could not be climbed. Total ground distance traveled was 37 miles.

The group is contemplating either an ATV, a digipeater or a Mode J FM transponder payload for another launch sometime in the Spring of 1991.

[ANS thanks Andy MacAlister,WA5ZIB, for the information for this bulletin]

AMSAT QSL BUREAU INFO

HR AMSAT NEWS SERVICE BULLETIN 356.06 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 22, 1990
TO ALL RADIO AMATEURS BT

AMSAT QSL BUREAU ALIVE & WELL; NEEDS YOUR QSL CARD & S.A.S.E.

WB8OTH wishes to remind all OSCAR satellite users that as Manager of the AMSAT QSL Bureau, he needs your SASE! Perry says that he has many QSL cards waiting for hams to receive but he can't forward them because of the lack of a envelopes from addresees. Perry adds that everyone who uses OSCARs, especially with the increase in DX activity seen on AO-13, should send him their outbound cards along with several SASEs so he can quickly turn around that rare DX QSL. Send your QSL cards and SASEs to following address:

AMSAT QSL BUREAU
1850 Lise Avenue
Obetz, OH

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 356.07 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 22, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times.Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date	Phs	mode	UTC	NCS	Alt.	U.S. day
29 Dec 90	206	B	1500	KA5SMA	WB9ANQ	Saturday

05 Jan 91	214	B	1900	WD0E	WA5ZIB	Saturday
13 Jan 91	99	B	0500	WB6LLO	N5BF	Saturday
19 Jan 91	210	B	1445	WB9ANQ	KA5SMA	Saturday
26 Jan 91	211	B	1830	WA5ZIB	WD0E	Saturday

Jim White (WD0E) is scheduled to discuss Pacsat file server ground software operation with the net on 29 December 90. He and others on the pacsat test team will be available on nets through the Pacsat operational release period to assist new users.

John Champa (K8OCL), AMSAT-NA Executive VP will discuss AMSAT participation in advanced projects such as the World Space Foundation Solar Sail, Lunar Polar Prospector, and SEDSAT (supported by the Detroit Oscar User's Group) during the net session on 13 January 91.

Roy Welch (W0SL) will discuss his new job as AMSAT Software Exchange Manager and what this means in terms of improved software user support during the 26 January 91 session.

It is the intention of the Operations Net management to have guest speakers approximately every other week to provide up-to-the-minute information on topics of interest (such as Microsat ground station software, AMSAT Software Exchange,and WARC 92). As guest speakers and topics are confirmed they will be published in ANS.

Nets are scheduled for North American geographic coverage and time zones although other parts of the world are often within the footprint and check-ins from everywhere are welcome. Those who don't have adequate and convenient coverage from this net are encouraged to schedule their own nets via AO-13. Consider moving some of your HF AMSAT Net sessions to the satellite or retransmitting nets from one to the other! Write to AMSAT Headquarters or send a note to N5BF @ WB6YMH with your schedule to have it included in ANS.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

NEW AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 356.08 FROM AMSAT HQ
SILVER SPRING, MD DECEMBER 22, 1990
TO ALL RADIO AMATEURS BT

The new winter transponder schedule for AO-13 is as follows:

```
 Mode-B : MA   0 to MA 165 | <= IF eclipses over-drain battery in
 Mode-JL: MA 165 to mA 190 |    Jan 10 - Feb 06, B-OFFs MA 20-65
 Mode-LS: MA 190 to MA 195 |
 Mode-S : MA 195 to MA 200 | <= Mode B is OFF; no swishing!
 Mode-BS: MA 200 to MA 205 | <= QRP on BS please.  High power
 Mode-B : MA 205 to MA 256 |    wipes out mode S experimenters.
 Omnis  : MA 240 to MA  30 |
```

This schedule is expected to span from 28 December 90 to 25 March 91

The command team requests that you make a specific effort to use QRP on Mode B between MA 200 to 205. This is specifically to help those people who are experimenting with Mode S.

Magnetorquing operation is expected to take place during the week of 24 Dec 90. This operation takes place during the portion of the orbit closest to perigee (MA 000) and is done primarily to reorient the spacecraft for improved solar panel illumination. During magnetorquing, the transponders will be off (typically between MA 220 and MA 60).

During the Winter, the worst Sun angle (11 March 91) will be -27 deg, resulting in 89% illumination. AO-13 will experience eclipses by the Earth from 11 January 91 to 6 February 91, the longest being 82 minutes (MA 32-53). If battery drain is excessive during this period of time, it may result is Mode B being turned off during MA 20-65 until 6 February 91. AO-13 will experience Lunar eclipses on 16 March 91 (50%) and 14 April 91 (23%).

Once magnetorquing operations have been completed, the spacecraft attitude of AO-13 is expected to be:

```
               BLON = 210.0  and  BLAT = 0.0  for 31 December 90
     Spin Rate should be brought up to 30 RPM from the present 27.6 RPM
```

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations. The transponder may be used, carefully, at all points of the orbit except MA 254 - 006 when eclipses occur. If beacon or transponder signals show signs of FMing, users should cease all transponder use immediately. An APPROXIMATION of the spacecraft attitude for AO-10 is :

```
            BLON = 2.0    and  BLAT =  0.0  for 29 December 90
```

The FCC *does* regulate receivers, but only the ones that are marketed commercially. They have two concerns:

(1) Emissions from the local oscillator;

(2) Fair coverage of broadcast bands and other frequency bands.
For example, all CBs, even if receive-only, must have (or be able to be crystalled for) all 40 channels. All TV sets must have both VHF and UHF with comparable performance and ease of use on all the channels.

This is to prevent broadcasters on some TV channels from being at a competitive disadvantage. Likewise, AM radios have to cover the whole AM band; FM radios have to cover the whole FM band, and so forth.

-- MAJOR SOLAR FLARE ALERT --

DECEMBER 23, 1990

Flare Event Summary
Potential Impact Forecast

MAJOR ENERGETIC EVENT SUMMARY

Another significantly powerful solar flare blasted off the western limb today from Region 6412, which up until now has produced relatively little flare activity despite its magnetic complexity. This flare was rated a class X1.0/2B Tenflare which produced major radio emissions at 245 MHz which peaked at levels of near 18,000 s.f.u.. This flare was associated with a major Type II radio sweep frequency event, but was not apparently associated with a Type IV event. A satellite-level proton enhancement was observed at 10:05 UT on 23 December and reached an unofficial peak of 5 PFU (particle flux units) at 11:40 UT on 23 December. The proton levels have been decaying since that time and are now at near background levels. The flare was located at N11W68 and lasted 40 minutes. It began at 09:33 UT, reached a peak x-ray intensity of X1.0 at 09:52 UT and ended at 10:13 UT on 23 December. It was also associated with a significant SID/SWF whose duration unofficially lasted approximately 50 to 70 minutes over sunlit portions of the earth.

This major flare is the first X-class flare to occur since 27 August of this year, when a short-duration class X3/2B flare erupted near the central meridian and produced a minor to major geomagnetic storm approximately three days later. However, unlike August's event, this flare is not expected to have a serious terrestrial impact (see below).

Region 6420, which produced the major flare of 22 December, has been separated into two separate active regions due to its extensive elongated spot complex. The new region has been numbered 6423. Region 6423 is the less active of the these two parts. Region 6420 is still capable of producing M-class flare activity, although major activity from this region is not currently anticipated. There is, however, a slight risk of a major flare recurring from Region 6420 over the coming days.

Region 6412 is the area being closely watched at the present time. Until it rotates beyond the western limb on 24 December, this region will remain capable of producing another major energetic flare capable of influencing the terrestrial environment. The probability for major flaring will decrease on 25 and 26 December as this region disappears beyond the western limb. This will be the second time Region 6412 has disappeared beyond the western limb. On it's previous rotation, when the region was numbered 6368, it produced only a single major flare and numerous M-class events. There is a significant possibility that this region will again return to the eastern limb near 7 December. Preliminary analysis of models suggest that if this region persists through to its third appearance on the eastern limb, the potential for major proton flaring will become elevated. These predictions are far from conclusive, however. Yet, it is an interesting side-note. More will be known when models are more extensively consulted over the next week.

POTENTIAL TERRESTRIAL IMPACT FORECAST

Today's major class X1.0/2B major flare may have a slight terrestrial impact anywhere from about 22:00 UT on 25 December to 24:00 UT on 26 December. Geomagnetic activity may become slightly enhanced between 25 to 27 December due to this flare. However, if any activity does materialize, it is not expected to be too significant. Geomagnetic activity should remain near unsettled levels on these days, except for active periods which may be observed over high latitudes. There is a slight risk that magnetic coupling with a possible shockwave from this flare may produce active to minor storm levels. Although this risk is small, it should be noted incase this scenario proves more accurate than the one presently being relied on. Recurrent coronal-induced activity is expected to increase on 27 December, which may combine with any flare-related effects to produce higher than expected magnetic activity. For the moment, however, flare-effects are expected to be low. Recurrent geomagnetic activity will likely dominate, with only unsettled levels being witnessed over low and middle latitudes, while high latitudes may attain active levels.

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---

December 23 to January 01, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW FOR 16 DECEMBER TO 22 DECEMBER.

Solar activity this week has been mostly moderate. Regions 6412 and 6415 were predominantly responsible for the activity early in the week. By mid-week, a new active region rotated into view (labelled Region 6420). This region has produced several M-class flares and also spawned one major energetic event. The major flare occurred at 22:46 UT on 22 December. This event reached a class M5.3 x-ray level and was optically classified as a type 2B flare (moderate in size and brilliant). However, it was not accompanied by any significant radio bursts or sweep frequency events.

Another major energetic event of greater significance was the class X1.0/2B major Tenflare which occurred from departing Region 6412. This region was associated with an intense 245 MHz radio burst of 18,000 s.f.u.. It was also accompanied by a major Type II radio sweep. This flare was located at N11W68 and lasted 40 minutes. Terrestrial impacts from this flare included a strong SID/SWF and a satellite-level proton enhancement. Any geophysical activity occurring as a result of this flare will be reported in next weeks STFR report.

The largest region on the disk was Region 6412 (which was the mammoth sized Region 6368 on it's last rotation), which maintained a respectable size of about 3,600 million square kilometers (1,400 million square miles). This region gradually became increasingly complex in it's magnetic and optical characteristics, attaining a type Beta-Gamma magnetic configuration by mid-week. It maintained this configuration and it's size throughout the remainder of the week. It will rotate beyond the west limb on 24 December. Although this region may change configuration rapidly if flaring continues on the far side of the sun, there is still a relatively high probability that this region will return again near 7-8 January.

Region 6415 became quite active early in the week during its growth period. It attained a size of about 1,300 million square kilometers (520 million square miles) and managed to spawn numerous M-class flares. As the week progressed, this region began to decay and flaring decreased. By the end of the week, just prior to its disappearance beyond the west limb, this region spawned a class M4.3/1N flare at 23:21 UT on 22 December which was associated Type II and Type IV sweep frequency events.

The number of M-class and C-class flares which occurred this week produced a significant number of SID's/SWF's. Distortion, aborption, noise and fading were all quite noticable during the daylight hours, particularly over the low and middle latitudes. Average SID durations were around 40 minutes, with between about 1 and 3 SID's occuring daily throughout this week.

Geomagnetic and auroral activity was dormant this week. No significant periods of auroral or geomagnetic activity were reported. The average planetary magnetic A-index figure this week was 5, which is significantly lower than the "normal" for activity this year. The earth is currently traversing the solar neutral sheet boundary, which is generally more magnetically stable than regions to the north or south of this boundary. Combined with a lack of coronal-induced corpuscular emissions, geomagnetic activity has remained relatively quiet.

Radio propagation conditions this week have been normal to above normal throughout the week, excluding the occasional SID-related SWF's which hampered HF communications. VHF communications were normal this week, with a few instances where SID-enhancements provided brief periods of favorable DX conditions. No auroral backscatter was possible this week.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Recent trends indicate that global solar activity has increased. Moreover, it appears as though two active solar longitudes have redeveloped separated by about 150 to 180 degrees, which is characteristic for the active sun during sunspot maximum. Almost all of the solar indices confirm this. The activity is expected to peak either early in January or February, followed by another decline to more stable conditions in March through to about June, 1991. If the models prove correct, the rotation of the previously active longitudes near 26 to 28 December may herald several weeks of increased major and M-class flaring. There is also an elevated risk for solar-induced geophysical impacts in January and/or February. The coming week will be the deciding factor on whether or not activity levels will peak in January or possibly in February.

This activity seems to conform well with the models which are predicting a surge of activity early next year, perhaps even into February. Activity is expected to increase notably with the return of Region 6397 (as well as all of the other regions which formed within the same longitudinal zone during the last rotation). These regions are expected to begin returning anytime now, but a particular surge in the solar flux is expected between near 26 to 28 December. Combined with Region 6420 (which was split into two separate active regions on 23 December - the new region is numbered 6423), which has produced one major flare already, overall flare activity is expected to increase. Solar activity should remain moderate with at least one M-class flare occurring per day. The risk for major flaring will become elevated as the active longitudes near 26-28 December rotate back into view.

Recurrent geomagnetic activity is expected to increase magnetic indices to quiet to unsettled levels by 24 or 25 December. Activity is not expected to be significant, however, provided flare-related shockwaves do not contribute to the activity. High latitudes may experience periods of active conditions while middle and low latitudes should remain mostly quiet to unsettled, becoming mostly unsettled by 25 December. Conditions throughout most of the coming week should be mostly quiet to unsettled, excluding any flare-related activity. For flare-related activity, consult the flare alerts when they are issued.

Auroral activity will become slightly enhanced at high latitudes this week, but no significant periods of activity are anticipated unless major flaring contributes to the activity, which will be covered in any major flare alerts which are posted. Middle latitudes will be hard-pressed to observe the relatively low auroral activity this week, due to lunar phase.

HF and VHF radio propagation should be normal to above normal this week, with similar levels of noise and daytime absorption occurring over the middle and low latitudes due to solar activity. The solar flux, sunspot number and background x-ray indices are all expected to begin increasing this week. It is presently difficult to predict the solar flux values which might be achieved, although present models suggest that the solar flux might reach levels as high as 260 (or perhaps higher). Sunspot numbers may break 250 by mid to late week. The increased ionizing solar radiation should provide very good opportunities for HF DX this week, provided geomagnetic activity remains at quiet to unsettled levels. VHF communications will experience brief periods of enhanced E-layer ionization due to flare activity that may significantly contribute to the potential for DX. There is a significant possibility for openings on 6 meters this week (particularly later in the week). MUF's will increase this week to levels near or above 50 MHz over many locations, particularly over the mid to low latitudes. Unless flare-related events contribute to terrestrial activity, no significant periods of auroral backscatter are expected this week on the VHF bands.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 23 DECEMBER

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type
6412	N16W79	017	3480	FKI	17	015	BETA-GAMMA
6418	N19E06	292	0030	BXO	04	009	BETA

NOTES:

This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.

NOTES:

Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

NOTES:
These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

I believe this will happen to a good number who get no-code. After they have talked to the same people over and over on the UHF and VHF repeaters and have mastered packet radio (if one ever does), then hearing of the HF contacts their friends have made, many will be motivated to learn the code.

The problem with the code requirement before "no-code" was that some opted out of ham radio before they ever got their license, as a result of problems real or perceived with learning the code.

(I was one; in the mid 70s I tried for nearly a year to learn the code but couldn't as I have a mild form of dyslexia. However, about 18 months ago I learned of the Code-Quick (tm) method and was able to get from 5 wpm to 20 in about a year.)

Sure, there will be plenty who stay above 30Mhz, just as there are many who now never go above the HF bands, but as a card-carrying social scientist, I would love to see statistics 5 years from now on the no-code licensees to see how many and for what reasons they added code to their qualifications.

Yes, a certificate of sucessful completion for element 2 or 3A signed by a VE can be used when requesting a VEC examing group to submit a competed form 610 on your behalf.

Right and wrong, I believe. Yes, he has to start over, but there is
a 2-year grace period. (Not that this extra year will help *him.*)

Jim,

I have been trying for a few months to track down a systematic
list of the code requirements and resulting HF priv for different
countries. Do you -- or anyone on the net -- have such?

At least a few of us believe that some of the people we come in
contact with in public service work will now get their ham licenses in
order to do that kind of activity, and in that context, limiting them
to 220 and above would be a dis-service to the community as a whole,
because of the existence of a large existing public service
infra=structure.
I am in touch with a couple of my local EC's, and will try to get them
to push on the ARRL from their angle to get this objection by the ARRL
to the current no code Technician privileges dropped.

Right! One of the biggest sources of new hams, at least at first, will
be families of present hams. These people's main contribution will
probably be public service. (Additional operators for existing stations,
etc.) And, at least where I am, public service (in the local area)
relies on the 2-meter band to the exclusion of any other.

>communications setups. This *does* include integrating non-amateur services
>like cellular, Part 15 radios on 49 MHz, and even CB when they're

>appropriate... it's the *know-how* that is our most important asset,
>regardless of where or how we apply it. Know-how that ranges from pure
>technical to organization and integration of communications to produce
>effective and efficient communications. I still count the latter as
>technical, because you have to have at least *some* understanding of the
>possibilities before you can make rational decisions on how to integrate it
>into a working communications system. This is especially important in
>emergencies, when the local hams might be the *only* ones who know how to take
>a hodge-podge of radio equipment and devise a working emergency communications
>network out of it.
>
>The simple solve-it-from-within solution is to drop the theory as well as the
>code. THIS IS THE WRONG SOLUTION! It destroys our most important asset.

Amen, brother! I think the most effective way to improve one's grasp of theory is learning by doing rather than a complex set of examination hurdles to jump, but theory, and more important the ability to put theory to practical use, is vital to amateur radio.

>The problem, and therefore the solution, are *outside* amateur radio. It's
>the same problem faced by the technical industries in the U.S. right now and
>looming large over their futures: the general public needs to be made aware
>of the importance of technical skills and knowledge, to the point where the
>general public will push for improvements in education and for more college
>students to major in technical areas.
>
>This is the *biggest* threat to amateur radio. Not code/nocode, not a sudden
>inrush of unruly "CBers", not the encroachment of commercial services on our
>bands. HAM RADIO IS UNPOPULAR BECAUSE UNDERSTANDING TECHNOLOGY IS UNPOPULAR.
>After all, how much do you need to know to operate a cellular phone or a
>Nintendo?
>
>If there is one area that I would recommend be addressed by all radio amateurs
>as quickly as possible, it is this one. Because it's not just ham radio that
>will go down the tubes if we don't....

You are right of course, but there is something we can do *with* amateur radio to change the situation. We can use amateur radio as bait to hook some of the young proto-technoids and get them interested in learning about technology for the fun of it before they lose their sense of wonder. If we're reasonably clever, we can be part of the solution instead of part of the problem. I believe that the ARRL is heading in the wrong direction with it's program to entice retired people into amateur radio. Instead, we should be working on the grassroots level to get amateur radio back in the classroom. Two of our local clubs are sponsoring amateur radio stations in middle schools. My packet club has purchased and donated packet equipment for one of the schools. Some of our members donate their time helping science teachers bring the wonder of electronics alive for these kids.
And it's working! We've got a bunch of new Novices, several Techs, a few Generals, and even one Advanced class kid out of the effort so far. The biggest challenge by far is to welcome these kids into our clubs, to include them in our activities, to let them become leaders. I know it hurts old men's egos to see smart young kids pass you by, but that's what it's going to take

to revitalize amateur radio and our country's technical ranks.

> passband the high SWR would occur. If I'm running at a single, crystal
> defined frequency, can't I tune my antenna for good SWR regardless of my
> filter?
>

If you are going to stick to one frequency, a Chebyshev is the wrong thing to use. Put all the poles on the frequency you intend to use. In other words, put a `bunch of copies' of your series resonant Hi-Q circuit. This approach maximizes your out of band rejection. You only want to use complicated pole/zero structures if the filter needs to work over a broader band.

Inductors and Capacitors are never perfect. They can and do burn a few ergs of energy in their internal resistance.

Bob

A friend interested in the codefree tech asked me if I could find him a program for programmed instruction in the theory elements of the test (as opposed to sample tests). He uses a clone under MS-DOS 3.21.

Hello to ANY/ALL

My New Sister in Law tells me she can not even send a Christmas Card
to my Brother which was only married 2 weeks before being sent to
"Place Unknown" If it is possible for you to come across him without
to much trouble could you tell him that we miss him, and would like to
say Merry Christams. His unit is one of those that moves so much they
do not even assign them a APO number. He is supose to be stationed
anywhere from East Coast USA to Europe to Mid-East. Subject to Change
without notice.

INFO:
Tech Sgt. Brian D. BUHNERKEMPE
C-5's out of Travis CA USA
301 st MAS

FLAMES:
Feel free to send them. Just send a X-Mass card to the
Mid-East at the same time.

William

--- MONTHLY SOLAR TERRESTRIAL REVIEW ---

November 1990

Report Issued In-Part from Data Released by the
Space Environment Services Center
Boulder Colorado

MONTHLY ACTIVITY SUMMARY AND SOLAR CYCLE OUTLOOK DECEMBER 1990 - JUNE 1991

We are now in month 51 of solar cycle 22. Activity levels increased in November over October values, however, solar indices were nearly the same for the two months. This adds more support to maintaining July 1989 as solar maximum of cycle 22. Although prediction models are indicating an increase in activity and solar indices at the beginning of 1991, the models remain confident that July 1989 was solar maximum. The daily sunspot number actually fell in November, although the daily sunspot area increased. This phenomenon was due in large part to the unexpected growth of Region 6368 to mammoth proportions. This region finally became the second largest region of this solar cycle, surpassed only by Region 5395 of March 1989, which produced exceedingly severe solar flares during its transit on the solar disk. However, unlike Region 5395, Region 6368 failed to produce sustained high levels of activity.

Region 6368 did produce the only major flare of the month. It was an M7/1N flare at 23:17 UT on 26 November as the region was rotating over the west limb. Region 6368 also accounted for at least 14 of the 25 M-class flares detected during the month. Three of the 25 M-class flares were uncorrelated and may have been attributable to this region also.

There was a very slight proton enhancement at satellite altitudes beginning at 06:05 UT on 11 November which lasted about six hours. Protons were detected above background levels several times during this period, but never came close to event levels. The most likely cause of this enhancement was the M2/SF flare at 04:36 UT on 11 November from Region 6361.

The geomagnetic field was mostly quiet during the month of November with the following exceptions: On 16-17 November, high latitudes reported minor storm conditions while middle latitudes experienced active to unsettled conditions. The disappearance of a 19 degree segment of filament on 13 November is believed to be responsible. Then on 27 November, high latitudes experienced major storm conditions and middle latitudes experienced minor storm conditions. A sudden magnetic impulse of 21 nanoteslas was measured at Boulder Colorado at 23:32 UT on 26 November, preceding the magnetic storm of 27 November. The solar wind managed to compress the magnetopause inward past geosynchronous altitudes. GOES satellites reported magnetopause crossings beginning at 15:55 UT on 27 November. Disappearing filaments or several M-class flares that erupted in the proper time frame are possible causes of this activity.

SIX MONTH SOLAR CYCLE OUTLOOK

Solar prediction models are still suggesting an increase in solar activity early in January or February of 1991. Preliminary analysis of activity during December has verified that activity levels have increased at least during December. Activity is expected to continue to increase, reaching a peak in January or February, followed by a decline to more quiet conditions until near June or July of 1991. Major flaring has increased dramatically during December. Models indicate a slight risk of at least one major proton flare occuring during the next pulse of activity. Although no proton flares have yet been observed during December, models still indicate a potential for proton flaring, particularly between approximately 7 January and 21 January.

Geomagnetic activity is expected to be higher in January than it has been so far in December. Monthly magnetic indices are expected to peak between February and April. Preliminary estimates indicate a potential planetary average A-index of near 23 between February and April, 1991.

Auroral activity could peak in January or February, depending on how intense the pulse of solar activity becomes during these months. If solar activity is below the levels expected for these months, auroral activity will probably peak in March. Models indicate a slight risk for a major auroral storm sometime in January or February, caused by potential major flaring. If the storm materializes as models suggest it might, auroral activity may become visible over low latitudes. However, this activity is strongly dependent on the intensity of major flaring. The models are not in full agreement with regards to the intensity of major flaring which might occur during these months. Hence, some reservations are being made with regards to the accuracy of the models.

HF radio propagation conditions are expected to be relatively good during January and February, except for periods of geomagnetic storming which is expected to significantly hamper attempts at HF DX communications. The number of M-class flares is predicted to produce fairly frequent daytime HF signal absorption, distortion and potential periods of near blackout conditions during potentially intense solar flares. However, MUF's will be enhanced due to the increased solar activity, which will permit very good DX opportunities on frequencies above 30 MHz. Night-time propagation conditions are expected to vary from very good to very poor. During periods of quiet geomagnetic activity, night-time propagation conditions are expected to be very good, with sufficient F-layer ionization to permit good DX possibilities on higher HF bands. However, fading and signal flutter will dominate the higher latitude paths. During periods of potentially strong geomagnetic activity, propagation conditions will deteriorate significantly over most latitudes. High latitudes may experience severe flutter and absorption during these periods. But overall average conditions during January and February should be relatively good.

VHF radio propagation conditions are expected to be normal to above normal in January and February. Frequencies near the 6 meter wavelengths are expected to be particularly enhanced during early January and possibly February as well. Openings above 50 MHz are anticipated during the early part of 1991, due to the increased ionization and enhanced MUF's. There is a good chance for auroral backscatter communications on all VHF bands during magnetic storm periods. If the intensity of magnetic storming materializes, widespread VHF auroral backscatter communications may become possible over high and middle latitudes, with a slight possibility for low-latitude auroral backscatter as well. Conditions should then fall to normal or slightly below normal levels from March until about June or July 1991.

NOTES:

- Xray Flare Classes (weak to strong): C, M, X (with sub-categories rated from 0.0 to 9.9 in each class).

- Optical Flare Classes (weak to strong): S, 1, 2, 3, 4 (with an attached figure identifying brightness: F-Faint, N-Normal, B-Brilliant).

- Locations are given in latitude and longitude as measured from the central solar meridian.

- Sweep Frequency Intensity represents the intensity of detected solar radio frequency bursts (bursts sweep over large frequencies). Type II and IV almost always represent ejection of solar material through the solar corona and into interplanetary space. Intensities are rated from 1 to 3+.

Hello Dan,

There is a packet BBS running out of the American Embassy in Saudi Arabia using the callsign 7Z1AB. The BBS is intended for handling mail only traffic for deployed U.S. military personel stationed in the Gulf region.
If you're intentions are to pass traffic through the net, you can E-mail a note to Jim Stone - who set up the link, explaining how much traffic will be passed and work out the logistics.

the E-Mail address for Jim Stone is:

"Jim%taueng.bitnet@mitvma.mit.edu"

Good luck
es 73,
Rich

  No, they didn't. They probably told you that if you can't distinguish
  between "who" and "whom" you can do without "whom" and just use "who".

  But the distinction is easy to make. It's exactly the same as the
  distinction between "he" and "him".

HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the Amateur Community (but there is other stuff on-line). As of now I have not attempted to promote this system any place except in the amateur channels (PACKET, USENET, & word of mouth), and will continue under this policy, as I hope to keep it oriented toward amateur radio. The various software for UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through user support I hope to keep the latest and greatest ham software on-line. Below is the information that is needed in order to access the BBS via Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs
Number: (301)-625-0817 -- 1200 & 2400 (Non-MNP)
Number: (301)-625-9482 -- 1200 & 2400 (MNP5), 4800 & 9600 V.32 (V.42/MNP5)
Number: (301)-625-9663 -- 1200 & 2400 (MNP5), 9600 & 19200 (PEP)
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS)
IP Address: 44.60.128.1 {wb3ffv.ampr.org} [for FTP access on 145.650 mhz ONLY]
Misc. Info: Machine is an 80486 computer running UNIX V.3.2 and features 700 Meg of on-line storage. Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage all to upload anything new that they come up with, as it is of benefit to all. Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release) [UNIX, MS/DOS, Amiga]
KA9Q TCP/IP (Version by G1EMM, PE1CHL, PA0GRI, Etc.)
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.1[2,3,4])
W0RLI BBS for the PC (Versions 6.xx, 7.xx, 8.xx, 9.xx, 10.xx)
MSYS BBS for the PC running KISS TNC's (Version 1.09)
AA4RE BBS for the PC (Version 2.10)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01)
Modifications for many HAM Rigs and Scanners

Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /usr/spool/uucppublic. To retrieve the files listing just use the following command:

```
uucp wb3ffv!~/FILES /usr/spool/uucppublic
```

This will move a copy of my files listing into your uucppublic directory. If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

HAPPY HOLIDAYS!!

```

The following is a list of some telephone BBSs that support Amateur Radio. Some of these are strictly for hams, while others support "SIG's" (special interest groups) for hams or have radio-related files or message sections.

Disclaimer: Due to the increasing size of the list, it will only be distributed on the packet networks once or twice each year as a multipart bulletin. Some SysOps consider even the split-up messages to be an overwhelming burden to the network and will inevitably block them, so if you do not receive it via packet, you should download the file HAMPHONE.91 from the Ham Radio archive section of SIMTEL20 (wsmr-simtel20.army.mil on Internet), from the K4NGC phone BBS at (703) 680-5970, or from the WB2COY phone BBS at (914) 485-3393.

If you call one of these BBS's and find nothing to indicate it's relationship to Ham Radio or find that it has been disconnected, let me know so I can archive it and clean up the list. I can't gaurantee the accuracy of this list, but I do strive to keep it as up-to-date as possible. Please send any updates, changes, or comments to me. 73, Tom Brown KA2UGQ.

Packet: KA2UGQ @ KA2UGQ.NJ.USA.NA

Has anyone on this list been there? I saw a blurb at the community radio station where I work with a picture of a VOA control board that was used from late 50's to 70's. It looks like it might be interesting.
I'd be interested in hearing about other museums with interesting communications exhibits. I tried to see a Communications Museum in Leningrad when I was there a year and a half ago, but it was closed for renovation. I'm told there's a telephone museum in downtown San Francisco but I've not followed up on that yet.

I've recently purchased a REALISTIC PRO-2006 scanning receiver and have a question regarding a modification -- restoration of the disabled frequencies in the 800MHz area. I apologize if this is the 'umpteenth this question has been posed.

Browsing through the January 1991 issue of "Monitoring Times" magazine, there was a reference to simply cutting a wire and hitting a key. Sounds simple enough!

Anyone that might be able to provide more explicit instructions would sure be of help! (If you might also know of other simple modifications, it would be appreciated!)

Thanks in advance...

-- MAJOR SOLAR FLARE ALERT --

DECEMBER 24, 1990

Flare Event Summary
Potential Impact Forecast

MAJOR ENERGETIC EVENT SUMMARY

Region 6412 spawned a class X1.8/1B Tenflare at 15:41 UT on 24 December. This flare was accompanied by modest radio burst emissions. The emissions resembled a Castelli-U type signature. The position of this flare was N10W80, which was just prior to the disappearance of Region 6412 from the western limb. Radio emissions at 245 MHz reached 2,600 s.f.u., but no significant sweep frequency events were recorded. Satellite-altitude protons again became enhanced due to this major energetic event. Protons at greater than 10 MeV became enhanced at 18:50 UT on 24 December, reaching 3 PFU at 20:35 UT on 24 December. Satellite level protons are expected to remain at enhanced levels for at least the next 24 hours.

Solar activity today has been quite high. Excluding the major X-class flare, three additional M-class flares occurred from Region 6420: a class M1.0/SF at 01:06 UT, a class M2.2/1F at 13:26 UT, and a class M1.0/1F at 23:00 UT (all on 24 December).

Complex region 6420 has now been split into three separate regions: Region 6422 (S16E46), 6423 (S19E24), and 6424 (S08E31). All of these regions are capable of producing M-class flares with a small risk for a major M-class flare.

The Space Environment Services Center has issued a condition YELLOW alert status for potential satellite proton events and PCA activity. This is in response to the powerful X-class flaring which has been occurring from Region 6412. This region has now rotated beyond the western limb, but will remain capable of producing terrestrially-influencable major flaring for about the next 24 to 48 hours. The potential for major flaring will be reduced by about 26 December provided the cluster of regions near 6420 do not change significantly in complexity.

POTENTIAL TERRESTRIAL IMPACT FORECAST

There is not expected to be a geomagnetic impact from the major X-class flare which erupted today from Region 6412. Geomagnetic activity is expected to remain mostly quiet to unsettled until about 27 December when activity could increase to active levels over low and middle latitudes. High latitudes may experience brief periods of low-intensity minor storming. Overall activity should remain mostly unsettled.

HF propagation conditions are expected to suffer from periodic fading and distortion over the next three days at least, due to frequent solar flaring. The durations of these SID's could surpass 60 minutes. The average SID duration is expected to be near 40 minutes. SID intensities will vary according to the strength of the solar flares, but should not provide anything worse than moderate fading and distortion.

Communications via polar paths are discouraged at this time. Absorption levels due to the recent solar activity and proton enhancements have increased over polar regions. The absorption is expected to continue for at least the next several days (until at least 27 December).

SHORT TERM SOLAR FORECAST

Regions 6398 and 6399 are due to return over the next 72 hours. These regions were responsible for significant levels of M-class flaring on the last rotation. The activity at these solar longitudes was quite impressive. This region rotated beyond the western limb in a very active configuration two weeks ago. If predictions are correct, these active longitudes should return in configurations still capable of producing potentially frequent M-class flaring. There is a notable risk that regions in these longitudes may have formed with characteristics capable of spawning major flares. More will be known as these regions begin to return.

It appears as though activity levels and indices may actually peak with the return of these active longitudes, which would correlate fairly well with prediction models which suggest a peak in early 1991. If Region 6412 returns as expected, it could very well return with a significant amount of magnetic and optical complexity capable of producing major activity. This region is a long-lived center which has retained a large size and respectable magnetic complexity throughout its last transit. This lends strength to the models which predict potentially significant activity from this center when it returns near 07 December. So January appears to look increasingly attractive with regards to a potential peak in solar activity.

CW/Morse-code itself may not be so interesting as a modulation/coding technique any more. But how experienced operators decode morse-code is very interesting.

After operating CW intensively in those contests, every hiss sound is decoded as Morse-code for me. Even wind seems calling like 'DE ....'. This symptom continues almost for a day, until I get enough sleep. My ear/nerve/brain system seems over adaptive to morse-code :-) Some kind of matched filter must be formed in my brain. Or it has been already built in my brain after years of over dose to CW. (addictive) And a hour of intensive operation may activate it.

As a little bit old-fashioned ham operator, I like CW very much.

As a scientist, I am very much interested in how human brain is adapted to CW/Morse-code. (Though I am amature in neuro science.)

As an engineer, I want to emulate CW decoding mechanism of human brain by electronics such as DSP, neural network, software, ...
Interesting enough !

As someone pointed at, CW is like bicycle. Both are easy for human, but very difficult for machine to manipulate. Is there already a robot which can ride bicycle very well ?

masa

Organization: The Internet

The following is a list of some telephone BBSs that support Amateur Radio. Some of these are strictly for hams, while others support "SIG's" (special interest groups) for hams or have radio-related files or message sections.

Disclaimer: Due to the increasing size of the list, it will only be distributed on the packet networks once or twice each year as a multipart bulletin. Some SysOps consider even the split-up messages to be an overwhelming burden to the network and will inevitably block them, so if you do not receive it via packet, you should download the file HAMPHONE.91 from the Ham Radio archive section of SIMTEL20 (wsmr-simtel20.army.mil on Internet), from the K4NGC phone BBS at (703) 680-5970, or from the WB2COY phone BBS at (914) 485-3393.

If you call one of these BBS's and find nothing to indicate it's relationshipto Ham Radio or find that it has been disconnected, let me know so I can archive it and clean up the list. I can't gaurantee the accuracy of this list, but I do strive to keep it as up-to-date as possible. Please send any updates, changes, or comments to me. 73, Tom Brown KA2UGQ.

Thanks for the support. I'm glad that there are some hams that
recognize the fact that non code hams can contribute to the ham
community. Personally, I'm a very busy person, and would not want to
devote the time to learn code, only to abandon it after getty my licence.

I want to play mostly with 2M and packet, I don't need moorse for that.

I haven't followed this group for some time (years!). But at that time there was some talk of applying DSP techniques for ham radio modems; I don't remember who it was but someone planned to do some work using a DSP board (TI chip I think) for a PC. Did anything ever come out of it?

Also, I think someone offere his DSP board for sale a couple of months ago - I cannot access the message anymore, so I'd be interested to know who it was if the board is still there, or to know about any other sources.

```

Here's something to lighten your spirits in this Christmas season.
After coming back from Christmas Day vacation and trudging thru many
articles on the good and bad points about NoCode, I decided to get
some statistics (ok, so I'm a Math major :-).

I started keeping track of the posters and whether or not they were for or
against NoCode, or if I couldn't tell, and if they were against Code
(big difference between being for NoCode and being against Code). I've
got a list of about 20 names with my category assignments......But then
I figured if I posted that, I'd get flamed for posting it, so I didn't.

But then I went back and did a manual search to determine HOW MANY
articles there have been on NoCode. My computer still stores about 1200
articles, reaching back well beyond the 13Dec90 announcement.

The first article posted I could find was "Where is it going?" dated
6Dec90. Next one was posted on 9Dec90...and it was in full force by
then, even BEFORE the Official Announcement on 13Dec90. Of the 782
articles since since 9Dec90, (drum roll, please) 336 of them were on
the NoCode war and 128 of them were on the rec.ham->rec.radio.amateur
war. That means 43% of all articles has been NoCode, 16% has been
admin related, and only 40% has been the cream that most of us read
rec.ham-radio for.

Now, can we please get back to "the good old days" and get some
substance back into rec.ham-radio?

CHEERS and have a Happy New Year!
Diana

RADIO SPORT GAMES, 1991

(The following is directed mainly to hams in the states of Oregon, Washington, and California and all the other western states. We thought it might also be of interest to the general rec.ham-radio community.--Bob.)

Greetings to all members and friends of the Friendship Amateur Radio Society, Inc. (FARS).

International radio sport history was made in September 1989. For seven days, the Portland, Oregon and Niigata Japan Radiosports teams had the great pleasure of representing the U.S. amateur and Japanese radio fraternity at the First Sister Cities Friendship Radio Sports Games in Khabarovsk, USSR.

The Portland Oregon Radiosport Games, planned for 1991 are the follow on event to the '89 games held in Khabarovsk. This event will bring together teams representing the US, Japan, Canada and the Soviet Union.

The Portland games will consist of 3 main events beginning with CW sending and receiving to test Morse Code skills. The Portland event will continue with team DF and conclude with the HF operating events.

THE CW COMPETITION

Reception of the Morse code is judged on speed of reception (1 minuteK of correct copy) and the number of errors during the test run. scoring may be given for the method_ ofN transcription of the received text when handwritten.

The transmission of the Morse code is judged in three major areas, speed, correctness of transmission and style. The competition also contains bonus scoring based on the difficulty of the keying device -- straight key, vibroplex key or automatic keyer.

THE OPERATING EVENT

The operating event includes a traditional HF sprint hosted at 5 stations in the Portland area. The contest will be conducted round robin with each team operating a portion of the contest at each of the five stations.

The HF event is a single transmitter event with only one signal on the air at any given time. Additional transmitting, receiving and antenna equipment may be present at the site provided only one transmitter is active at any given time.

During the HF sprint operating of the station shall be divided among members of the team with each receiving approximately equal operating time. Each operator shall be responsible for establishing, exchanging QSO information and logging the contact. The remaining members of the team may monitor the bands and act as spotters when not activelyK operating.

THE FOX HUNT

The Fox Hunt will be conducted according to international rules and is proposed for Portlands Forest Park. It will include 5 hidden transmitters located throughout the park.

WE NEED YOUR SUPPORT

Formal invitations (both personal and State Department) will be sent to the Soviet team via personal courier on December 16, 1990. The Soviets will be sending a team of (12) individuals, and have provided complete personal information on all of them. Their number includes a number of our dear friends, with whom we competed in Khabarovsk in 1989.

Yuzo, JR1WYB, a facilitator of the 1989 Games in Khabarovsk, left for Japan on December 9, and will be pursuing a number of objectives for FARS. He will be writing an article about the games for the pre-eminent Japanese ham magazine, "CQ Ham Radio," and will be soliciting the Japanese team for the 1991 games. Oba Zenichi, JN1JPX, a member of the 1989 Japanese team, has indicated interest in organizing the 1991 Japanese team, and will spend time discussing this with Yuzo during his visit.

Yoshiko, another 1989 Japanese team member, has communicated her great desire to compete in the 1991 games, and is expected to assist Oba in his efforts. Both Yuzo and Oba are fluent in Japanese, English and Russian, and are two of our premier supporters in Japan.

Short of a full page column, this account should reflect the excitement and momentum of preparations for the 1991 games. Much effort is currently being expended on three continents by individuals concerned for the continued international cooperation of amateur radio operators and the promotion of international radiosport and the Sister-Cities Friendship Amateur Radiosport Games 1991.
We are also actively promoting Radiosport as an official activity of the International Olympics games.

While the balance of the news is good, I must again solicit your support. FARS needs you!!!! In particular, FARS needs individuals to work in the areas of:
1)Planning/Organization - Board of Directors,
2) Housing for Guests/Competitors,
3) Trans- portation of international participants to events and excursions during visit,
4) Hosts for international visitors - both Japanese and Soviet guests will

want to spend time (dinner, family outings)
with American Hams. All have expressed a desire to experience our culture and
family life,
5) Individuals willing to help conduct the competitive events of CW sending
and receiving side),
Direction-Finding (DF - Portland), and HF DX (Portland). Guest/Competitors at
the 1991 Games will be attending
for the events, but will value their experience of us as individuals and our
way of life at least as much as any of their other activities.

6) We are also looking for those of you who are interested in serving as
judges or participants as competitors on
the US teams. Send us a note about your self and your qualifications.

FARS REALLY DOES NEED YOU!!! - as representatives of the finest hobby in the
world, our American Way
of Life, and what all of us at FARS&? consider to be the greatest community in
the U.S.A.!

If you are not currently a FARS member, we'd like to encourage you to join
NOW! FARS will value any
individual contributions offered. Your ideas and participation are vital! As
we embark on formal fund-raising in
the business sector, contributions of funds would be very useful, and we solicit
them from you as individuals or
organizations. Please send requests for membership information or contributions of
skills or financial contributions
to: Friendship Amateur Radio Society, Inc., P.O. Box 13344, Portland, Oregon
97213.

73, Happy Holidays, and my hopes for international goodwill and fraternity
through amateur radio

- Dick, UA0C\WA0DIM

Sorry, but this is genuine disinformation. The ruling is that applicants will be required to pass elements 2 and 3a. Period. Those are the same 2 and 3a elements as are around today (though, of course, the question pools are modified ever so slightly from time to time). These elements are commonly called the Novice written element and the Technician written element. You must complete element 2 before you can take 3a. If you pass 2, you will be given a CSCE for it, valid for one year. Same for 3a. Completing both of these will qualify you for the new Technician license. Thus the thundering hordes who have been dying to get on the air could, if they wanted, run out and take these this weekend, then send in their 610 once the ruling takes effect. In order to upgrade to General, you would then take both 1b and 3b. In other words, you

DO have to pass the Novice written exam before you can take the Technician written exam, you DO have to pass the Technician written exam before you can take the General written exam, etc. The only changes the ruling made were to drop element 1a as a requirement for Technician and to restrict Technicians who have not passed element 1a to 30 MHz and up.

Xref: gmdzi rec.ham-radio:18458 rec.ham-radio.packet:3293

I've recently been bit by satellite QSO's and have been working CW via RS-10 and have been following the DOVE telemetry. I would now like to proceed to full use of the Microsats. I have just sent for my AMSAT membership and am awaiting books, etc that are on order.

I currently own an HF rig, a 2mFM rig and a TNC. I understand that I need 70 cm recieving capability and a PSK modem to copy the downlink of the packet data. My questions related to this are:

1. Do you have any first-hand experience with the recieving converters that take 435 down to 10m? I have seen adds for Hamtronics but would appreciate any feedback on any you are aware of and/or have experience with. Obviously, my preference would be an all-mode UHF rig, but with the rest of the equipment I'm gonna have to buy, I'd like to get by for a little less for now and add that later.

2. I would also like information on PSK modems for use with the Microsats. I have seen Paccomm's PSK-1 modem (which also copies Oscar 13 400 baud telemetry). I have heard of the G3RUH (?) PSK modem but know nothing about it. What are the rest of you using?

3. I have read that the Paccomm PSK-1 modem will not work with the Kantronics KPC TNC's (which I have) so I will most likely be looking at replacing my TNC, too. I would like to upgrade to a

unit that will support KISS mode, TCP/IP, WEFAX, etc. as well as interface with the PSK modem. I would like to go with a unit that has some future, too. I am considering the PK232 and KAM. Any others? Any suggestions on any of them? Benefits, features you look for?

4. It sounds like a regular FM rig will work for the uplink on 2m. I have a Kenwood TR7800 (25W). Any problems with this? What are you folks using? Do I need a 2m all-band rig?

Thanks for any input. I appreciate the collective feedback and common sense approach from anyone. Satellite communications is an exciting new mode for me and want to spend my $$ wisely!

Gripe whine moan, and now that you get what you whined for, gripe moan and slam the opposition. Please explain to me how you KNOW that this "great influx of super-techies" is sure to happen? The way I see it, passing the novice and tech written exams to get on the air is EASIER than it used to be. What happened to the "more technically oriented" exam that was supposed to go with the no-code license? I think it is abundantly obvious that the RATIO of "more sophisticated technical people" to enter via the no-code path will remain unchanged or drop as long as the written exam does not reflect the sophistication. I have been helping friends and acquaintences enter the hobby for over 15 years, at a much better than 1 per year rate. From the informal survey I have verbally conducted, MOST of the new no-coders are going to be the spouses of current hams. Heck, my MOTHER is going for her ticket now at the age of ??, (WR4A's XYL :-) I don't think she would be insulted if I told the net she is NOT a sophisticated technical person. Since I have started efforts here at Intergraph in forming a communications club, most (not all) of the interested parties are MOSTLY interested in 2m autopatch privs. A few computer hackers are interested in wireless BBS and packet (some even TCP/IP) and 1 or 2 in ATV.

Please explain to me why the no-code license is going to cause a big increase in super-techie types when the test is not super-techie?

OLDE-PHARTE NOT IN THE LEAST AFFRAID OF YOUR "influx of sophisticated technical people" CUZ I'LL BELEIVE IT WHEN I SEE IT AND I'LL GET OFF MY SOAP-BOX WHEN YOU QUIT YOUR PATHETIC WHINING AND UNFOUNDED SPECULATION- Herbi (not of 14.313 fame) back to my DSP code, KM4JN

P.s. Keep it up Tad, somebody has to do it ....:-)

Restrictions or not they are CW only subbands as per Part 97....Your answer
seemed to imply that the originator of the subject was incorrect in stating
that 50-50.1 and 144-144.1 is CW ONLY (which they are! I didnt realize that
until I looked in the rules...hmmph..guess you do learn something everyday..
CW at 6 and 2??? Guess the Gonsets have a strong lobby!)

I have seen one, but have not yet purchased. They have a model
that takes standard cassettes and appear to have a model that
is similar that takes mini-cassettes. The model I looked at
(standard cassettes), does not have a line input, does not
include a AC adapter and sells for about 90.00 (list is higher).
The place I saw it could not find the manual and was too busy
for demoing, so there is much about the unit I don't yet know.

I don't know where the time stamps are stored. I hope they put
a digital burst on the other track of a stereo pair, but

I am just guessing on that.

The thing that has me bemused and amused is the tacit assumption in many ham circles that new no-code hams will be of lower caliber than existing hams. All the talk I've heard is that the 'new' techs may be better and conceivably turn out to be the ones who look down their noses.

It just dawned on you now? I've been picking up those vibes since the debate started. Plenty of hams are _afraid_ of an influx of more sophisticated technical people. They're afraid that this would raise the standards of ham radio to the point that people who don't know how a radio works might find themselves out of place no matter how fast they can send code.

You have to remember that the no-code license was the FCC's idea and the FCC was definitely not catering to outlaw CBers or slackers. The FCC was trying to deal with the fact that nowadays, our best electronics talent is not being attracted into ham radio.

People forget where the no-code proposal came from. The FCC has been
talking about it since 1940 and, until now, had been shouted down by
the ham community every time.

Absolutely correct. The new setup-to-be:

Novice: elements 1A (5 wpm) + 2 (30 q. Novice)

Tech: elements 2 (30 q. Nov) + 3A (25 q. Tech.)

Tech + 1A = (current Tech) Novice & Tech privileges

Novice + 3A = --- same thing ---

My only complaint is that the Novices still aren't in the V.E. program.
Too many Novice tests have been bought or given away.
Even the V.E. sessions are a bit lax at times - some groups more than others.
One, remains unidentified here, regularly passes those who fail miserably at
other local sessions. If anyone wants more info, post a request.
There are plenty of Extras what shouldn't be.

Sounds good to me.
This got me thinking of some differences between CB & HAM and that help make HAM operation well behaved. Certainly the pride and value of having earned the privelidge to be a HAM radio operator as mentioned above is a difference. Even the words "HAM radio operator" seem special to me. Another difference is having a authentic callsign and being required to ID, as opposed to picking a CB handle.
I never did decide on a handle for myself when I was trying out CB.
I was dismayed by the number of people who weren't practicing good CB operation, and I felt intimated by them. Plus I couldn't really think of anything to say.....not a really good environment for someone who's trying to overcome shyness. Anyway...I don't want to put CB down. I'm just thinking of why the VHF & UHF HAM activity I've heard seems well behaved to me, and why the chances of hearing well behaved CB activity is a rough _maybe_. The combination of pride, rules, and interest in radio seems to make quite a difference.

I took the Novice & Tech. tests at the end of November, so I'm anxiously awaiting you know what in the mail. I hope I enjoy being a HAM, and I sure hope I think of something to say for phone activity! :-)
I'm going to get involved in packet, and I'm also interested in trying out CW.

I hope the new codeless Tech. class does good things for the popularity
of HAM radio....seems like it will. And hopefully it won't cause
the problems some people are worried about. I think the codeless
class makes sense because there are so many worthy things to do in
HAM radio that take time and energy to learn, and if someone wants to
spend time & energy (& money! :-) on phone, packet, etc. instead of
on CW, well hey, that's fine with me. It could make for all the
better non-CW type operator. Just don't judge for other people the
value of CW or any other mode. If someone likes CW and you don't,
well then that person values CW and you don't. That's all.
Me, well I'd like to try a little of everything.

The General (Comm'l) license is just wallpaper as someone else put it. No
license at all required to work on domestic radios other than amateur.
And in my posting I referred to the Amateur General license. I don't think
the General phone was even in existance when the FCC still gave ham tests.

And even so, if memory is correct, they never tested for General, but only
gave that insignificant certificate to those who wanted it and whose 2nd or
1st phones were up for renewal.

So guess again.

]buts and end to this 14.313 problem.
]
The problem is NOT the FCC. It is the congress, which does not allocate the
FCC enough money to fund any significant enforcement. All you have to do
to confirm this is listen to the "sidebanders" between 10 and 11 meters.
They are blatant as hell, but few get caught.

Another thing to consider is that a lot of this stuff is not, in a
larger sense, very important. Is it more important to catch and
punish a robber or a jammer? This is, after all, a hobby. Jammers and
other turkeys (KV4FZ, K1MAN, BARF, etc) are
annoying as hell, but except when one is handling traffic, they are
not much of a hazard to society. I consider them to be more like
vandals - they destroy something we value, for no good reason, but
are not particularly dangerous. We'd all like to make them pay, but
how much are WE willing to pay to do this?

There are exceptions where jammers are dangerous. When I have operated
as net control on the Hurricane Watch Net, I have been badly jammed,
and it has hampered net efficiency - which could cost lives. I am also
aware of 3 incidents here in AZ in which potentially life saving calls were

prevented by a jammer (now deceased, himself) - all of these incidents
ending in the deaths of the victims. This sort of jamming is more dangerous
and more deserving of prompt and serious FC action.

>

The average age of amateur radio operators is 50. The average age of CB operators is between 20 and 30 (no one knows for sure since licensing for CB is now nonexistant). The number of CB operators is at least 10 times the number of amateur operators and they are all crowded into 40 channels. The classic generation gap between the more mannerly oldsters and the young rowdies is a reflection of social change not differing licensing requirements. The huge numbers and the extreme crowding make the problems heard on CB seem much worse than they are. If you confined your amateur operations to 14.313 Mhz and certain portions of the 75 meter band and certain 2 meter repeaters, you would think that amateur radio was as bad as CB.

We must wake up to the fact that amateur radio inevitably will face the effects of social change as the older generation dies off and new blood trickles in whether there is a code test or not. Now that there is not a code test for one class of license, this trickle may accelerate a bit. We must prepare to deal with these changes. Fortunately, we still have a bit of room so the intense crowding that CB suffers won't be a big factor in making things worse. Also we have the advantage that we outnumber the newcomers and will for some years to come. CB's problems started with an explosion of new operators who overwhelmed the few early users. There was no chance to introduce the newcomers to established operating practices. We have that chance, if we don't blow it. Things will change as the demographics and size of the operator pool changes. We have the opportunity to guide the changes that will inevitably come to amateur radio, if we are willing to get out and work to do so. Not all of the changes will be bad. We will either learn new ways ourselves, or be relegated to the old fossil's corner. Times of change are times of opportunity if you have an open mind. Only dead things don't change.

As a positive example of what you can do. In your licensing classes, spend the time you would have taken teaching Morse to prospective Techs, teaching good operating practice. On the air, welcome the newcomers and demonstrate by example good operating practice. At your club meetings, seek out newcomers and welcome them. Invite newcomers to participate in your activities.

To handle the inevitable troublemakers found in any new barrel of apples, dust off that DF equipment. Organize a group of turkey hunters. Bring social pressure to bear against the bad guys. As a last resort, work through the ARRL monitoring system to aid the FCC in shutting them down. Become a part of the ARRL monitoring system yourself, make it work.

We have the power to make amateur radio better than it is, if we are willing to work at it. Sitting on the sidelines gripping and whining won't do the job.

>>level they can keep up with.

I don't agree with this one at all, at least as applied to myself. I have no
problems with more technical people in ham radio; my apprehension about the
no-code license is that we will be inundated by the antithesis of those - the
unruly CB-outlaw types.

>It just dawned on you now? I've been picking up those vibes since the

>more sophisticated technical people. They're afraid that this would
>raise the standards of ham radio to the point that people who don't
>know how a radio works might find themselves out of place no matter
>how fast they can send code.

I _do_ have a problem with this, though: there should _always_ be a place in
ham radio for people who can contribute in non-technical ways.

This group is _extremely_ atypical of the general amateur population.
Usenetters are, by and large, technical people. That's _not_ true of the
amateur population as a whole. There are many folks who contribute to the
fulfillment of the basis and purpose of the amateur radio service without
ever picking up a soldering iron or firing up a compiler. The posters to
rec.ham-radio.* keep forgetting that.

Just to foreign nationals, the way I understand it. My father's father,
although of Italian decent, held Canadian citizenship during WWII. Upon
being faced with giving up his SWR, he decided to bring it to my mother's
mother's house. This way he abided by the law, but presumably was able
to listen to his radio when he wanted.

War is a strange thing indeed.

I agree...that's why Paul proposed it and I adopted it.

>I don't know about replacing `ham' with `amateur'. I think most people would
>call themselves `hams' and not `amateurs'. Besides, `ham' is easier to type.
>Basically, it doesn't seem to me like there's a good enough reason to change
>it from what it was. But i don't think it makes a big difference either way.

Who types newsgroup names?

"Amateur" is the official name of the service, and is internationally recognized. "Ham" is an American colloquialism. Which is better suited to an international network?

>I think that it'd be useful to have a separate `tech' group. Questions like
>``What sort of cut-off slope can i get with so-and-so filter?'' don't really
>belong in a general group. Regarding flames, the `legal' group is supposed to
>take care of that, so i don't see why that should stop us from creating
>another group. And regarding gatewaying, i don't see why both groups couldn't
>be gatewayed together. The mailing list members need never know there are two
>separate groups.

The problem there comes when mailing list readers reply to messages in the group. Naturally, they reply to the mailing list. Where should the list post those replies? Posting to just one of the groups breaks discussion chains, while posting to both will result to non-technical postings to the technical group and technical postings to the general group - which defeats the purpose of splitting the technical postings out in the first place.

[about naming the general discussion group .misc]
>I think this encourages people to classify their discussion into the right
>group, rather than just dumping it all in a parent group. There's already at
>least three subgroups, and most likely more will be added in the future. So
>we might as well do it right to start.

I'm leaning in this direction now. The precedent set by the other reorganizations in the recent past is persuasive.

Hey, I build, and experiment! I have only ONE piece of HAM gear that is 'stock', my HTX-100. Everything else is modified, or has homebrew attachments. A hombrew/kit based 10M-2M-SSB transverter. A Radio Shack TRC-457 converted to 1MHz wide on 10M (well, almost!). Scan mods in my Kenwood TR-2400. Homebuilt base charger, and home design 10W amp for my 3AT. I could go on, but when I commute in the car, all you hear is my 'yak' on 2M.

But you're right, there are appliance operators, and they make 2M just a marginal step from a party line phone. But those that I know like that are extras. But to be fair, they are experimentors on HF. One guy I THOUGHT was pretty sharp, and I still think he has immense practical knowledge on HF, thinks disabeling the PLL lock feature will 'fix' his PLL problem on his 2M setup. He's sure it's just to keep him from going out of band. Well, the guy may be totally wrong, but at least he went into the schematic and looked, although he doesn't understand PLL at all.

> So the CW question is easy to dispense with. Does a significant amount of military communication still use CW? Could a crisis arise today that would be more severe if no CW operators existed? If it could, if we still need CW operators, then the license structure should encourage CW training.
>
>
> Kip

As a former naval officer on submarines (out in '83), I can only speak a little about that area. .... certain foreign countries of interest use manually sent CW for their standard fleet communications. Intelligence specialists, gathering info on these guys, needed the ability to copy CW as if they were the other side's fleet operators (coded groups in a non-English language). It was also painfully obvious that the operator's shifts had changed when the 'fist' changed......

Our own comms, of course, were not manual CW. However, CW came in handy :

a. For UQC (underwater telephone) when voice reverb or s/n was too poor. The manual CW button on the box was good for the occasional 'R' or 'C'. (But the other station needed to know morse too. Send slow so they can read the table off the side of the box!)

b. Close aboard surface ship maneuvering uses flashing light CW for passing messages. Having the ability to read audio CW at 5 wpm transfers to reading light sigs to standard speed also. (You'd also be surprised at all the lights from docked vessels flashing out to the departing ship. And how many of them are just personal conversations between the signalmen :-)

I understand that the POWs in N. VN communicated in morse. Part of pilot training in the '50's was a Morse class. (My father did this)

Most of the civil aircraft navigational aids identify themselves in CW, though that's changing because reading the dots and dashes off the charts was too unreliable.....

But as a reason for keeping CW a requirement? I don't think it'll fly anymore. We don't have mandatory ROTC either.

Ron (CW has been berry berry good to me) Miller

Actually a low pass filter, for instance, becomes a lower and lower impedance as the frequency approaches resonance, at which time it becomes a "short" to ground. The energy is dissipated in the output resistance of the driving device. There will be "reflection" only is there is a "long" transmission line between thefilter and the driver and the input impedance of the filter is substantially different than the transmission line. Why do you assume that the amateur service, by changing the makeup of its testing process, will become like a service which has no testing at all? This is not a logical assumption.

I think what we have here is a case where some amateurs of limited knowledge of communications technology assume that if ham radio changes it can only change into the only other form of two-way radio they have personal experience with - CB. Well, I have news for them - there is far more to radio communications than ham radio and CB.

Since there is still theory, rules and practices testing, the no-code amateurs are more likely to be from the non-CB area. In this case, I think ham radio will benefit from their expertise in other areas. Indeed, we "old timers" may be put to the test to keep up.

There is a sad element here. The bitter oposition to no-code in some circles is likely due to the fact that code is the only thing singular and out of the ordinary that they can do. By dropping the code requirement, we take away the only thing they have to make themselves feel good about themselves. Such people, I fear, would rather see the no-code tech license fail and destroy ham radio than to lose their delusions of specialness.

Lieutenants are rather well removed from the policy making end of the chain of command in the Navy. Particularly the USNR (as opposed to USN) types. [:-)

Actually, recruiters will promise anything to anyone who is at 98.6 degrees Fahrenheit and can bend over during the physical without falling flat on his face. As often as not, the service after receiving the recruits' complaints about not getting what they were promised, shrug it off.

I can do the Usenet <> Fidonet link. I cannot now do any links to packet. I wonder how useful that would be? We're dealing predominantly with beginners who aren't on the air yet?

In the Navy, it's a Chief Petty Officer. An E-6 would be Petty Officer 1st class.

Unfortunately this is not true. If you don't operate CW, build CW rigs, talk to DX OPs that run CW you can't know what is going on out there. You don't know what you are missing because you don't speak the language. The percentage of activity that envolves CW is much greater than 2%. Ask anyone who runs all modes..digital, phone, SSTV, CW etc. what the true volume of activity is. you might be surprised.

As to this "elitist" charge, I know many many CW OPs and I have never met one who did not do his best to encourage other hams, both new and old, to take up the practice. You will find CW OPs to be friendly, patient, and enthusiastic about bringing others into the fold.The only people I know who think CW OP's are elitist are those who don't work CW. How can they know whats going on if they don't speak the language. When you get tired of the nasty hamming you will find on the phone bands, talk to some CW OPs and you may find that the ham radio that you really wanted to engage in does exist.

And I don't see much of a need for ARRL OO's to be more hyper about enforcement than the FCC is. I am sure that the FCC's decision not to have distinctive callsigns was deliberate, considering it would have been so easy to do.

>>CW at 6 and 2??? Guess the Gonsets have a strong lobby!)
>>73
>>WB5ITT
>
^Remember^!! part 97 is USA FCC rules; they do not apply to us in Europe. We
have our own rules. Vive la Difference! I looked in my copy of ITU Radio regs,
and there was no mention of 'CW Only' or 'Phone only' subbands to be seen....
I then looked at my licence; no restriction on modes/frequencies there
either (except on Pulse-modes which are verboten anywhere below 1GHz).
As I said before, 'CW only', 'Phone only', 'Data only' restrictions do not
apply to most of the World. The FCC has *no* jurisdiction outside the USA..

Thats the nice thing about 'Rules'; if you dont like one set, you can always
find another set!

>Could someone post to net or email to me the 10 codes used on police radio
>frequencies? Thanks.

10-codes vary a great deal from department to department, so you need to know who you are listening to. For instance, 10-4 is:

'Acknowledgement' to APCO (? I don't know what it stands for)
'Auto Accident (P.I.)' to Richland County sheriff & Mansfield police
'Auto Accident (P.D.)' to Columbus, OH, police

Also, many PDs and sheriffs don't use 10-codes, but just numerical codes. There is a BSSA (Buckeye State Sheriffs Assoc) standard list widely, but not universally, used in Ohio. The state highway patrol and the state department of natural resources (park rangers) have a different list. Many ambulance, fire, and EMS companies have their own codes.

My reference is "Scanner Radio Listings: Columbus & Southeastern Ohio". I recommend you get something similar for your region. I got mine from Universal Shortwave Radio, or try: Mr. Scanner\ 1107 Sharewood Ct.\ Kettering, OH 45429. Or check a local ham or SWL dealer.

I'm not sure the burglar alarm IS legal, but the justification for it is
that this is an emergency (immediate danger to life/property) situation.
Clearly the reverse autopatch for non-hams is illegal, despite the
fact that some repeater groups have it.

BID: $RTDX1214
Part 1 of 3.

Due to the amount of interest in the DX Notes, there will be no break over the Christmas period. There will be a change in editor from January 25th for a period of three weeks until February 12th while DX1 has a small trip away. The notes will be edited by I5FLN for that period with the assistance of OD5NG, so for those three weeks, please send your DX information to I5FLN via VK2AGE, TG9VT, OD5NG, or any other path that will get them to Luciano in time for the next week's news.

In the mean time, thank you all for your help and interest over the past years. We hope to continue in the same vein in the forthcoming years.

And now for the bad news. The bands have been lousy, terrible and at times nonexistent for the past week.

Our thanks this week go to: I5FLN, OD5NG, TG9VT, VK2EG, W2JGR and the

Tristate VHF DX Packet Cluster Network, as well as several other packet clusters. Thank you for your assistance with the information.

RTTY DX Notes 3of3 12/14/90

RTTY DX Notes for week ending 14th December 1990
BID: $RTDX1214B
Part 3 of 3.

VU2SJV nominates N2HOS as his QSL manager.

VE8RCS requests their cards via the Callbook address. Also see notes.

Notes of Interest:

Please note that cards for the HK0TU operation should go to HK3DDD only. Do not send them to the operator or anyone else.

Kure Island (KH7) should show up at any time and will be there until 21 December, but so far no reports.

PA3DUU will operate from Morokulien (on the Swedish/Finnish border) with the call of LG5LG December 22 to 29th, QSL to LA5DFA. at the moment it has no DXCC status.

3W3RR is still on track for Afghanistan late December, donations to NT2X. The Spratly operation has been delayed until next year.

HA9RE and HA8XX will be touring the South Pacific for the next 6 or 8 weeks. They will include Chatham Island, Rarotonga and Niue Island in their itinerary. QSL to DJ1ND.

VE8RCS, Polar Amateur Radio Club, are presently operating from Ellesmere Island, about 40km from the North Pole.

5B4XA reports that he suffered no damage from the recent earthquake.

But if you are missing some of your 'G' friends, they are possibly sitting in their fridges keeping warm.

GL DE DX1 (VK2SG).

This is taking another turn...

No one will argue that if you don't know CW, you don't know what you are missing. CW is it's own language, and the people IN CW usually are very courteous and friendly. The unfriendly people are usually (IMHO) the people OUTSIDE CW, but who learned it and AREN'T using it. I'm not saying that if you learn CW your a jerk if you use phone.

Where and when people become imature and assine is beside the point.
Whether people enjoy CW or not is beside the point.
The point is should people be FORCED to become CW proficient!

There is a big difference here in the arguments. Here is a small aspect of HAM radio that is forced on people, regardless of their desires and wants. I think CW would be more successful if it was offered as INCENTIVE, not as a requirement, or 'paying dues' to join the club.

SB RTTY @ ALLBBS $IRDX1290
IRDXA 12/90 Bulletin

BID: $IRDX1290

IRDXA Project Status Report 12/90

The International RTTY DX Assoc (IRDXA) provides RTTY equipment to DXpeditions and resident amateurs willing to provide contacts from rare DXCC countries.

Thailand - RTTY is still not authorized. IRDXA PK-232 will be active at HS1AC (Science Museum) when RTTY is legal.

Tristan de Cunha - ANDY, ZD9BV and his bride ZD9CO are both active. Listen to his Wed/Sun sked with W4FRU on 28466 at 1700.

Rodriguez - 3B9FR made a few contacts in late Nov. His IRDXA RTTY gear but has been very scarce on any mode. Please encourage him.

Papau New Guinea - P29BT was QRV for a few weeks with his IRDXA gear very low power after blowing his transmitter. He will be in the U.S. for a month. He hopes to return to P2 in January with a new TS-440.

Malpelo - HK0TU (Raul) and the Malpelo crew did a spectacular job. Best run expedition and pileups in several years.

Malawi - IRDXA sending equipment to 7Q7LA in early December. Thanks to all who send donations. This potential new one negotiated by W8SEY.

Juan Fernandez - CE0ZZZ another well run DXpedtion. Congrads guys.
Bangladesh - Vince Thompson K5VT plans to return as S2VT in late February with IRDXA RTTY gear. X ur fingers.

Spratley - Romeo, 3W3RR is making a return trip. IRDXA is trying to get new RTTY gear into his hands for the trip.

Thanks to all who came to the rescue of IRDXA in our time of need. We are now solvent (at least for the moment) and shipments are going out. Please don't hesitate to help if you enjoy working the new ones.

IRDXA, 356 Hillcrest St, El Segundo, CA 90245 USA.
Phone (213) 322-7112 or fax 213-322-7114.

This is not necessary, as programs such as SuperMorse have user adjustable timing parameters. I used SuperMorse 3.15 to prepare for my Novice exam last summer, and found it extremely friendly and helpful. I've seen it run on 8088, 80286, and 80386 without any problems (clock speeds ranged from 4.77 to 25 MHz). I don't have the info handy on where to get it (it's shareware and I got it from a BBS), but if you want it and can't find it anywhere, send me email and I'll try to work something out.

>defined frequency, can't I tune my antenna for good SWR regardless of my
>filter?

If you have a narrowband signal, a Chebyshev filter is the wrong thing to
use. Align all the poles (tuned circuits) up to the same frequency for
a single-peaked response. You get a lot better attenuation of the
undesired signal this way.

>Also, a more theoretical question on filters. A low pass filter prevents
>high frequency energy from reaching the load. However, the filter is
>comprised only of inductors and capacitors, so it can't dissipate that
>energy. Furthermore, the filter components can't store it either, since
>that would result in a long term uptrend in stored energy which would

>really functions as a reflector in its stopband, sending energy back to

>the source rather than allowing it to reach the load.

Correct. Although if there's a direct connection between source and filter (no transmission line), it is more useful just to think of the filter as a reactive load (inductive or capacitive) in the stop band.

>Of course, this means that the source must absorb all of the stopband
>energy. I'm building a QRP transmitter that filters a square wave to
>get a suitably pure sine wave. That's no problem. But if I add a
>power amp stage to get more power later, I think this means I should
>amplify the sine wave rather than the square wave. Because if I
>amplify the square wave and then filter it, the amplifier output stage will
>have to absorb the now amplified harmonic energy. Right?

If you feed the square wave directly into the amplifier, you will essentially have a "class D" amp. This is more efficient than a class C amplifier, but has higher output harmonics. In theory, a class D amplifier is 100% efficient. When the output stage is "ON" (zero ohms), there is no voltage across it, and thus no power dissipation (P=EI). When the output stage is "OFF", there is no current through it, so again P=EI=0. In reality, of course, the "ON" resistance is never zero, and the switching time is never instantaneous, so the efficiency is not 100%. I believe actual efficiency is a strong function of the topology of the output filter network.

Because the burglar didn't set it off - he doesn't even know it's there. The
control operator set it off when he established the conditions which would
produce telemetry to notify him about perturbations in the repeater environment.

Actually, the disconnect packet did not have to be ACKed by the ground
station. (Gary has verified this.)

But the QSO-number packet did have to be ACKed, which presumably kept
a lot of people out of the log. :-(

I'd have to assume that an omenmeter measures Omens, which must be
the reciprocal of Nemos, the unit of salt water signal strength
improvement. 1 Nemo is equal to 12 gallons 3x10^3 ppm NaCl H2O
per trunkmount meter watt. This makes Omens a terribly inconvenient
unit to use, although, due to physical constraints, it is much
easier to build an Omenmeter than a Nemometer.

Joltmeters measure caffein.

:-) :-) :-) :-) :-) (and, for those who know more "CW" than "usenet",
HI HI HI HI HI).

In <davet@tsdiag.ccur.com (Dave Tiller N2KAU)> Dave says:

]In article 28281 of rec.ham-radio Dube writes:
]
]>It is not illegal to MODIFY equipment.
]See below.
]>It is not illegal to BUILD equipment.
]For just about any other service, yes it is.
]>It is not illegal to OWN a receiver.
]For cellular phone without a service contract? Yes it is!
]For 10.525/24 GHz in Ct, Va, and Dc, yes it is!
]>It is not illegal to OWN a transmitter.
]>It is not illegal to TEAR UP equipment (presuming it's yours).
]>
]>It doesn't take a lawyer to figure this out; all it takes is the ability to read
]>and apply common sense.

]Perhaps you should apply a bit of your own wisdom to yourself.

OK, I'll try.

]Regarding the CB service and modifying radios:
]
]Title 47, Part 95
]
]95.425 (CB Rule 25) May I make any changes to my CB station transmitter?
]
](a) You must not make or have any one else make any internal modification
]   to your CB transmitter.

If the "you" in this rule happens to be me, I can do this if I am a person
certified as technically qualified as stated in 95.424 (b) below. However,
I agree that this is beside the point.

Applied common sense:
Once modifications have been made, the type-acceptance has been voided and
the transmitter is no longer a CB transmitter. You can no longer use it in
CB service (nor any other service that requires type-acceptance); but you
may use it in the Amateur service since that service does not require type-accepted equipment.

]further:
]
]95.424 (CB rule 24) How do I have my CB station transmitter serviced?
]
](b) ... internal repairs or internal adjustments should be performed by
]   or under the immediate supervision and responsibility of a person
]   certified as technically qualified to perform transmitter maintenance
]   and repair duties in the private land mobile services and fixed services
]   by an organization or committee representative of users in those services.
]
I might meet these requirements, but this does not mean that I can modify any
type-accepted equipment to operate outside the conditions of its type-acceptance. On the other hand, I might modify it anyway, and I could lose my

license by so doing.
]
]For the Private land mobile radio services:
]
]90.427 Precautions against unauthorized operation.
]
](b) ... no person shall program into a transmitter frequencies for which
    the licensee using the transmitter is not authorized.

Applied common sense tells me that this is tantamount to modifying type-accepted equipment (see my point above).

]For the Aviation services:
]
]87.73 Transmitter adjustments and tests.
]   A general radiotelephone operator must directly supervise and be
]   responsible for all transmitter adjustments or tests during install-
]   ation, servicing, or maintenance of a radio station. A general radio-
]   telephone operator must be responsible for the proper functioning of the
]   station equipment.

ibid.

]I have read parts 0-19 and 80-97 exhaustively. I don't claim to remember
]everything I've read, but I sure remember that your above generalizations
]are not always true. The above references were gleaned from the regs by
]quickly glancing at the indexes of the individual parts. Please read the
]regs for other services before you arrogantly generalize and patronize other
]readers of rec.ham-radio.

Well, I happen to think they are true; otherwise there are lots of Hams who are in real deep crap by operating equipment taken from type-acceptance services and placed into operation in the Amateur services.

I don't believe in gunbarrel vision when it comes to regulations. One needs to think about the intent of the regulations.

73,
Dube   N5PDK

Subject: SAREX QRZ list as of 12/16/90
Keywords: robot, QRZ, SAREX, shuttle
Message-ID: <47526@apple.Apple.COM>
Date: 20 Dec 90 20:36:16 GMT

Organization: Apple Computer Inc., Cupertino, CA
Lines: 112

I received this note from Tom Clark of the SAREX project the other day. It lists the callsigns that have been verified so far as having been heard by the SAREX packet robot. As he mentions, the list of stations actually worked by the robot will be released later.

Subject: SAREX "QRZ" Lists

Only a few of the SAREX "QRZ" Heard logs as monitored around the world have been received here so far. Folks are reminded that we really do need the data from the QRZ beacon. The plea for this data went out before each of the earlier abortive launch attempts. Unfortunately I had to be away at a professional meeting during the flight and it seemed that none of the SAREX news reiterated the request.

What we need is the text of the "QRZ" beacon, complete with the beacon serial number and some sort of indication of the date/time (UTC preferred). Such information can be sent on packet to

SAREX@W3IWI.MD.USA

or via internet smtp mail to

sarex@tomcat.gsfc.nasa.gov

So far about a dozen people have sent in logs covering only 20 of the 1300+ "QRZ" beacons and with big time gaps in the coverage. This means that we have a total of about 700 lines of log with 376 unique calls in the list as having had at least one packet frame heard by the shuttle. About 30 countries are included in the list. A couple of bogey calls (like TEST and KJ9) as well as some folks' typos (note both WQzeroP and WQohP) are seen.

If you aren't in the list that follows it means one of two things:

1. The shuttle did not hear you
2. Nobody has submitted a "QRZ" beacon for the time you were active

There is the hope that Ron captured some of the QRZ beacon data to the disk on the Grid laptop during the flight but I haven't seen those logs yet. There was not enough memory in the SAREX TNC to save all the calls heard, so the list of the 35 most recently heard calls in the QRZ beacon may be the only record of your having been heard! It really is important to have the QRZ beacon data sent in ASAP.

The "QSL" worked list was saved in both the TNC's RAM and in the Grid, so the complete list of stations with completed QSOs will be distributed as soon as we analyze the flight logs.

STS-35 SAREX ROBOT "QRZ" LOGS DE W3IWI -- December 16, 1990

ARRL AMATEUR RADIO NEWS RELEASE #30
PART 1 OF 2
BID: ARNR001   DEC. 13, 1990

FCC CREATES CODELESS CLASS OF AMATEUR RADIO LICENSE

For the first time ever, starting in February it will be possible to obtain an Amateur Radio license in the United States without passing a Morse code test.   The Federal Communications Commission (FCC) has eliminated the need for new Technician class Amateur Radio license applicants to demonstrate proficiency in Morse code in order to have all amateur privileges above 30 MHz, The implementation date may be as early as February 1991. Technicians who obtain their licenses prior to that date will be grandfathered, meaning their existing HF privileges will continue.

The codeless Technician written examination will have 55 questions.

New Technicians wishing to gain access to the HF privileges below 30 MHz now enjoyed by Novices and Technicians will be required to pass a 5 WPM Morse code test before three Volinteer Examiners accredited by Volunteer Examiner Coordinators, and will be given a Certificate of Successful Completion of Examination (CSCE) to serve as evidence of their qualifications. There will be no call sign designator to indicate Technicians who have or have not passed a code test.

The FCC took this action in response to numerous petitions and public comments. By offering a codeless class of license with privileges exclusively abova 30 MHz, an entry level license will become available to those who find the Morse code a barrier to becoming an amateur radio licensee. The FCC decided to retain the current Novice Class operator license as an alternate entry level license for those persons able to pass the 5 WPM Morse code test instead of the more comprehensive written exam required for the Technician Class license. No changes in Novice examinations or privileges were announced.

At a press briefing held just after the Commission's meeting, FCC Private Radio Bureau Chief Ralph Hallar said, "The Amateur Service is not growing as it should relative to what it has to offer." He said that the Amateur Service is where our nation's technical expertise comes from--that the changes should attract people who are interested in computers and digital communications, and should help the U.S. to be more competitive.

February 1991 QST will carry more details.

ARRL AMATEUR RADIO NEWS RELEASE #30
PART 2 OF 2
BID: ARNR002
DEC. 14, 1990

ARRL APPLAUDS FCC RETENTION OF NOVICE LICENSE, SEEKS INPUT ON PRIVILEGES FOR CODELESS TECHNICIANS

Responding to the Federal Communications Commission action in PR Docket 90-55 creating a codeless class of Amateur Radio license, the President of the American Radio Relay League, Larry Price, W4RA, noted with pleasure that the Commission had decided to retain the Novice license as a means of entry into Amateur Radio and to adopt a codeless license with a meaningful written examination requirement. Our members were very strong on both of these points, because they Couldn't imagine how we could maintain the character of the Amateur Radio Service without them." Mr. Price said.

However, President Price sounded a note of caution with regard to the privileges the Commission plans to grant to Codeless licensees, "The formula developed by the ARRL Board, which called for privileges above 220 MHz, was based on extensive membership input. It was carefully balanced to offer attractive privileges while protecting existing patterns of amateur activity." While it will take sometime to gauge the reaction to the Commission's action. Mr. Price observed that the FCC formula is likely to be less acceptable to many amateurs than the League's. He asked that League members share their views with their elected Directors, who collectively determine League policy.

"Before we can decide whether to request that the Commission partially reconsider its action, we'll have to see the Report and Order," said Mr. Price. Usually it takes the FCC from several days to several weeks after a Commission action to release an item after editorial review. There is a 30-day window of opportunity following release in which petitions for reconsideration can be filed. Mr. Price noted that the ARRL Board was holding its regular meeting on January 18-19, 1991. "The timing looks good for a careful review of the Commission's action at that meetlng." he said.

Since I have a General Radiotelephone study guide (as published by Sams) on my bookshelf, I suspect that they did test for the General at one time or another (if they do know, I don't know. Brian Kantor probably knows (and may even still read this group) and could possibly tell us).

Of course, it could just be all my overheated imagination...

In recent article cy5@cunixa.cc.columbia.edu (Conway Yee [N2JWQ]) writes:
>I must disagree. IMHO, much of the opposition is due to the "because I
>went through this shit, you must go through this shit" syndrome. This
>phenomena is most clearly observed in the treatment of medical interns/

>residents but can be discerned here also.

This is also the justification for fraternity hazing, parental discipline tactics, etc. It's basically saying "its that way because its always been that way." It's a common societal tendancy.

Personally, after seeing that the no-code license is going to be available, I decided I should go ahead and do it (if only to get some use out of all the radio gear I seem to be accumulating :-). But after looking at about 5 books on Amateur Radio (including the ARRL Handbook and, my personal favorite so far, "How to be a Ham", by W. Edmund Hood W2FEZ), I've decided that most of the aspects of Ham Radio that I find "charming" (like climbing trees to put up huge dipoles, buying an archaic tranceiver at a flea market for $25 and getting it running, and DXing) are related to <30MHz operation. On the other hand, the aspects of Ham Radio that I find most "powerful" (like Packet Radio and ATV [fast-scan]) are available to the new codeless tech.

I mean, if I point at my HT and say to my friend, "Look at my Amateur Packet Radio Station!", I think I'll get chuckled at a bit. It doesn't look very impressive. On the other hand, I could always use the description I used for the original (classic) Macintosh: it only looks small when it's off!

Anyway, I've pretty much decided that 5WPM is trivial, and once I've got equipment tempting me to operate <30MHz I'll probably _upgrade_ to Novice (so to speak). I will probably never operate CW without the aid of a computer to en/decode; it just doesn't interest me. (OK, maybe occasionally trying to understand random morse I hear somewhere... but it's not something I would try to get _good_ at!)

Please note: Code/NoCode is a heated issue. Please don't flame me, and if you must, please do it on email.

Cheers!

-Eric

P.S. Is the salutation '73' from the median impedance of a dipole?

{Gee, I thought I had an amateur radio license. I guess I accidentally got a
{CW radio license. I'd better write to the FCC and see if amateur radio still
{exists or not. :-(

Last time I looked at the regulations, CW was legal on ALL amateur
frequencies, and only has a few EXCLUSIVE CW freqs.

As a one time Canadian, I would point out that Canadian phone bands have
ALWAYS coexisted with US CW!

CW is even legal through repeaters even if there IS a speed limit :-)
(Got to check on that one BTW)

I always find it interesting that it is the long-term Technicians that propose the two level or classes license structure. I wonder want the real motivation is to propose the present Techs should be grandfathered to full HF priviledges. I feel it more they want the full HF priviledges and don't want to learn the code. Actually there is more to learning the code on upgrading. It also is learning the answers to more theroy questions. Otherwise there would be few if any General class license holders.

Most countries that have fewer classes than the US still have some minimal requirement for minimal priviledges, and a full priviledge class for a more difficult exam along with a no-code license. This is a more reasonable proposal.

What are the implications of charging at less than the rated current?
I've been charging a 10V 450 mAh at 40ma overnight. The pack says to
charge at 45 mA for 14 hrs. The pack never seems to get above 9.6 V
(on the other hand, the radio receives fine. I haven't transmitted because
it's an as-yet unmodified commercially licensed radio, and I don't have
a license yet even if it _were_ modified!). The charger is just a 12VDC
supply an a resistor (and a block of wood and two screws!).

Thanks!

-Eric

]Probably the biggest incentive for my posting was the bold printed, red
]warning sign that came with my Uniden 2510 10meter rig. They threatened
]that if I ever modified my rig (added the jumper that enables CB) and returned
]it for repair, not only would they not repair the radio but they would also
]notify the FCC.
]
]This bothers me. It's assumed that since I can use the radio on CB, I'm using
]the radio as a transmitter and have done something wrong.

It bothers me too.   I can understand their not wanting to work on the radio, but I can't understand their threat to notify the FCC. And even so, what if they did?

It is very likely that they feel that they are being put under the gun if they send the radio to you with this mod. I wouldn't be surprised to find that they have had to certify in some way that they will not ship radios that are capable of operating in the CB band without being type-accepted for that service. This being the case, they could get in trouble by sending it back to you, even though they *did not* do the mod themselves. After all, how could they prove it was you, and not they, who did it.

Some people (and probably you) can do such neat work that it might look like it came from the factory that way! Might it not be that their "notification to the FCC" would take the form of letting them know that they received it that way, so as not to take the chance of losing their rights to sell the radio in the US?   Might it not just be a case of CYA, rather than a threat to "tell on you?"

Just musing....

I'm confused. Forgive me if this is a dumb question.

The question list I have has elements 2A,B,C,D,E,F,G,H,I; 3A,B,C,D,E,F,G,H,I; etc. I see references to Novice being element 2, and the codeless tech being 3A, or 3A and 3B.

What about 3C thru 3I?
My book lists these as pertaining to Wave Propagation, Amateur Radio Practice, Circuit Components, Practical Ciruits, and Signals and Emissions.

Am I looking at a really old list? The book's from 1986.
("How to be a Ham", W. Edmund Hood, W2FEZ, Tab Books).

Some of this material is covered in a cursory manner in element 2 (and I presume that the Novice exam consists of all the subelements A-I of element 2). Does the tech. exam really only require more knowledge of Rules (3A) and Operating Procedures (3B), no additional theory?

If so, I've been studying _way_ too much. :-)

P.S. My father has study guides and stuff from the 40s and 50s-- things have changed a lot! (He never became a Ham, but is considering it now...)

Thanks! (and sorry if this is too stupid)

-Eric

REASON FOR POSTING HERE

For all readers that like to DX FM, for all that like to listen to that distant or weak non-commercial FM station, or listen to that commercial station with the rare format, this information is for you.

I have just found what I believe is the best FM antenna in the world! I am not at all associated with this manufacturer, or distributor and will not profit in any way from any effect on sales that this posting may cause. My motivation is that I have sought long and hard for an antenna like this and never found one. In fact, write-ups in various club publications mention the best FM antennas and never mention this one; I think few people know of it, and am soliciting opinions of readers with any experience with it. I do not own one yet, and would like to hear from someone who does.

PHYSICAL DESCRIPTION OF ANTENNA

Imagine the loop antenna found on the back of most television sets for UHF reception. Then imagine that a loop antenna is used for FM [in North America, 88-108 MHz] reception. The FM loop is much bigger due to wavelength, with the diameter of a standard FM dipole antenna. This loop adds in front to back ratio since signal from one direction of a circularly polarized station will be increased [horizontal plus vertical] while in signal from the other will be decreased [horizontal plus vertical, but 180 degrees out of phase]. This loop is the antenna feed.

In front of the loop are a long series of directors, similar to a standard fringe area VHF or FM antenna. The difference here is that they are not on a single plane as in most fringe or yagi antennas, they are on three planes: one is at the center of the loop, one at the top of the loop, and one at the bottom of the loop.

Behind the loop are reflectors, but these too are not in a single plane. In fact, they are similar to UHF corner reflector antennas, but with much larger physical dimensions.

In short, a side view of the antenna looks like this where 'x' signifies an antenna element perpendicular to the page [display?].

In article <41662@ut-emx.uucp> kipper@ccwf.cc.utexas.edu (Kip Ingram) writes:

Gad! TWO technical questions in a SINGLE day! Must be the new no-code license :-)

{Hi. A quick question about Chebychev low pass filters. The ARRL Handbook
{says that the passband SWR depends on the passband ripple (bigger ripple,
{bigger SWR). My intuition tells me that that would only become a problem
{if you actually used the filter all over the passband; SOMEWHERE in the
{passband the high SWR would occur. If I'm running at a single, crystal
{defined frequency, can't I tune my antenna for good SWR regardless of my
{filter?

You would probably get better results tuning your filter slightly, but in principle you are correct. The nature of the so called "ripple" though is to introduce a (hopefully) small reflected power even in the passband. This is probably at a theoretical zero at certain discrete frequencies (no modulation either!), but for ham radio that really isn't a concern.

Fixed frequency services such as broadcast and commercial fixed communications though often use some very exotic tuning techniques to get better efficiency/lower spurious radiation.

{Also, a more theoretical question on filters. A low pass filter prevents
{high frequency energy from reaching the load. However, the filter is
{comprised only of inductors and capacitors, so it can't dissipate that
{energy. Furthermore, the filter components can't store it either, since
{that would result in a long term uptrend in stored energy which would
{violate the assumption that everything is steady state. The only place
{left for the energy to go is back to the source. So apparently a filter
{really functions as a reflector in its stopband, sending energy back to
{the source rather than allowing it to reach the load.

Neglecting losses in the filter etc., that is true.

{Of course, this means that the source must absorb all of the stopband
{energy. I'm building a QRP transmitter that filters a square wave to
{get a suitably pure sine wave. That's no problem. But if I add a
{power amp stage to get more power later, I think this means I should
{amplify the sine wave rather than the square wave. Because if I
{amplify the square wave and then filter it, the amplifier output stage will
{have to absorb the now amplified harmonic energy. Right?

If you simply use a nonresonant low pass filter that is true. If you use some form of resonance you can get a "flywheel" effect which is the principle of class B, C and D RF amplifiers - the conducting element (dare I say vacuum tube?) only conducts over a small portion of the RF cycle, depending on the tuning of the output "tank" circuit to restore a good sine wave.

This is one reason why the broadbanded RF amplifiers are generally designed
to be linear. (Meaning DC to 1Ghz BTW, as opposed to all of 2M).

In practice this is mostly a matter of how close you run things to burnout.
Harmonics are just about always a lower amlitude than the fundamental, so
absorbing them in the power amplifier simply increases its dissipation
slightly.

{A Tech is a Tech is a Tech; welcome, all who will operate with common
{sense and consideration of others!

No matter WHAT their class of license!

One question about the new no-code tech license: I thought I read somewhere
that no-code techs would get 2x3 calls. Will a person with element 1A added
still be able to get a 1x3 call? My wife is interested in getting her license,
and I am wondering if I should try to speed up the process in order to get
her an old-style tech license (and therefore a shorter call) before Feb. 15.

hmmmm attribution on that is confusing.
Accidentally i will assume. I made no
comment in my posting (line filler mode kicks in...)
about the "E" flags, though i recall them,
so it could easily have been the same
edition. The "E" was originally a US Navy
Award, much coveted to the most excellent
(or was it efficient) ship in fleet/squadron
or formation. It was prewar. During WWII
it was used with the vendors to symbolize the
same thing, excellnec above and beyond the
expected. Eventually, during the war, it
became the "joint army/navy E".

(My apologies, sort of, for the NET.BANDWIDTH
and particularly, the group.bandwidth usage.
BUT. I happen, in fact, to share Jim's views
on those who served in the military in WWII,
and at any time, and the values of patriotism.
I hold high respect for those who served, and
will not allow any misunderstanding on that.)

Somebody has misunderstood somebody.

It is legal to modify any kind of equipment for use in the ham bands,
and to build ham gear from scratch.

It is *not* legal to build CB equipment from scratch or to make CB
equipment by modifying equipment intended for other radio services.

In CB, you can only use equipment that is FCC type-approved for CB.

I'm with you!  I was just flipping through the articles in here and I was
struck by the amazing lack of technical discussions.  I'm interested in
radio, not codes, licenses and laws.

Surely, the topics currently active in this group are important to amateurs
everywhere, so I think they're appropriate.  I just don't happen to be
interested... so rec.ham-radio.tech would be nice.  I'd hang out there.

Actually, though, sci.electronics might do just fine.

In article <7880390@hpfcdc.HP.COM>, perry@hpfcdc.HP.COM (Perry Scott) writes:
|> I must be missing something here, Paul. Maybe you need to explain the
|> difference between "(en)coding" vs "modulation".

I can explain this. Encoding is the representation of symbols (e.g., the letters of the Latin alphabet that we use to form words in the English language) in a different form that is more amenable to transmission over a (usually binary) communications channel. Encoding examples include ASCII, Baudot, EBCDIC and Morse Code.

The term "coding" can also apply to the reversible transformation of groups of bits for the purposes of improving on the raw error characteristics of the channel. In this case you have several distinct coding/decoding operations in series, e.g., the coding of keystrokes into ASCII and then the coding of ASCII-encoded characters into a forward-error-corrected code (Golay, Reed-Solomon, etc). (Some people also use "coding" to refer to the reversible transformation of groups of bits for the purposes of obscuring the meaning of the message to unauthorized interceptors, but this is more properly called "encryption").

Modulation is the process of varying the characteristics of a carrier signal to carry information over a channel. The carrier signal may be audio (e.g., on a telephone line), RF (for radio transmission) or light (for optical links). The carrier itself may or may not be sent as well.

Even in a CW station, the coding and modulation steps are distinct. If it's a manual station, the operator does the coding (and decoding) while the transmitter and receiver do the modulation and demodulation.

|> I always thought a CW
|> transmitter was either ON or OFF, which also sounds distinctly digital.

Yes, a CW transmitter is a digital modulator.

|> I also observe that most digital demodulators (which are usually FM in
|> one form or another) employ analog technniques (such as slope detectors)
|> in the early stage of the decoding process. Like I've said, I don't
|> understand your distinction between decoding and demodulation.

All modems are hybrid analog/digital devices; that's their function. Remember the origins of the term: MOdulator/DEModulator.

|> As for CW being an AM mode, that's a bit of a stretch. While CW takes
|> on two amplitudes there is no information in the amplitude itself.
|> Also, the sidebands are zero-width.

CW as hams know it *is* most definitely an AM mode. The modulating waveform is binary digital, slow speed and almost "square" (i.e., its rise and fall times are short with respect to the on/off durations). The modulation factor is 100%. *ALL* of the properties of more conventional AM systems are present in an on-off keyed CW system, including the production of sidebands. It is *impossible* to send information over a channel of zero bandwidth. Remember the Shannon formula:

$$C = B \log_2(1+ S/N)$$

where C is the channel capacity in bits/sec and B is the channel bandwidth in Hz. If B = 0, then C = 0, no matter how large the S/N ratio is.

If you look at it in the time domain, there certainly is information in the amplitude of a CW signal - there are two possible values, "on" and "off". If you look a typical CW signal in the frequency domain, you will see that, as with AM phone, quite a bit of transmitter power goes into the (informationless) carrier, and relatively little energy lies in the (information-bearing) sidebands.

Suppressed-carrier AM schemes such as BPSK (which is nothing more than suppressed carrier DSB-AM with a digital modulating signal) is much more efficient since all of the transmitter power goes into the sidebands. Unfortunately, I don't know of anyone who can copy BPSK signals by ear, although they are readily copyable with simple hardware.

I have no information on this recorder, but I do use a home brew set up that gives me a similar result.

Use a -stereo- cassette deck and pump WWV in one channel and the other audio channel can be used to record what you want (need). This does require 2 radios, but that 2nd radio can be a cheap one since it only sits on a time station.

This works not only for those times when your going away, but makes reception reports a lot easier ;-)

Now if I could only find a cheap dual component cassette deck.....

I'm in search of a software package that will give satellite footprint information (i.e., maps) given information about the satellite antenna (e.g., boresight, pattern, gain, etc.) system. If the program can

provide satellite ground tracks that would be a plus, though I already
have something that will do that.

I'm not necessarily looking for something that will run on a PC....I can
put software on most any platform (Sun, VAX, others) so I'm leaving that
open right now.

The application is not ham radio per se, and yes, I am aware of the ham
(i.e., AMSAT, etc.) satellite tracking programs.

Please e-mail any replies and I will post a summary if anyone shows
interest in this.

73 es thanks in advance,

```

  Well since the CB band doesn't require a license and it sure seems like the
  FCC has lost all control over it, why not start tommorow? And no, there is
  no smiley after the above.

The FCC has acted and depending on who you believe, the bands will
soon be overrun with undisciplined axe murderers or the average

IQ of the radio amateur population will double overnight as the pent-up hoards of technical geniuses swarm into the amateur ranks.

Why don't we wait and see? In the mean time, let's see if we can't agree to a cease-fire here on the net.

Here are the proposed terms of the cease fire:

1. No-code proponents promise to refrain from using the term "old phart" when referring to CW enthusiests.

2. In return, proponents of Morse code will agree that given infinite dollars, digital signal processing system can approach the performance of a trained CW operator. The only exception is emergency conditions on a deserted island where only a single transistor, a battery and a 20 ft length of wire is available.

3. Both sides agree to welcome all newcomers to the hobby whether they enter with or without code credentials.

4. Both sides agree to stop blaming the mess on [insert whatever band you think is most messed up] on the existence or lack of any licensing requirement.

5. Both sides agree to spend more time enjoying the hobby of amateur radio and less time flaming on the net.

6. Both sides agree that neither side has a monopoly on their ability to fullfill the stated FCC goals for the amateur radio service: : public service, advancing the radio art, advancing communication and technical skills, expanding the reservoir of trained operators/technicians/electronics experts and enhancing international goodwill.

Please forgive this elementary question folks; its been a long time. I held a General Class ticket from about 1963 to 1975 when I left the US for Australia.

Simple question: Can I get the license re-instated simply, or must I take the written and code tests again?

Reply by e-mail; thanks.

Well, as long as its 5 to 1 against your position, I may as well add mine. I tend to feel that ham radio already has several self filtering and self policing mechanisms that keep it pretty much in line. Most individuals who go after ham licenses are going to be technically oriented, or at least have a mind tuned to understanding logical left-brained concepts. While it may be true that you could have absorbed the tech material in one sitting (I did it in one evening :) there are many people out there who cannot, either by ignorance or sheer stupidity. Those are the people that get filtered out.

Amateur radio also has a proud tradition of Elmering and self-policing. Implicit in hamming is the statement "this is serious radio, behave accordingly." Let's face it, you didn't REALLY learn how to become a ham until after considerable "on the job training" and guidance by other hams. I think this far overshadows any influence a "sincerity" test would have. The sincerity test is when a new licensee gets on the air and "pays his dues" by operating and honing his skills.

CB is not a very good example. Since there were NO filters, the service was not respected. If you want people to respect something, they need to work for it. Also, there was no clearcut purpose to the service, it was overloaded by unscrupulous equipment manufacturers, there was no guidance or elmering by other CBers, and the FCC saw it as a way of allocating an unwanted band and filling the Treasury coffer with mail-in licenses.

I am in favor of no-code above 30 Mhz, not because it would increase the number of hams, but because there is no compelling need to know code for VHF operation. Other Western countries have successfully implemented such a license, why do we remain behind the times?

A written exam given by an HONEST VE system (which it is, mostly) would encourage respect for the hobby. The tradition of self-training and policing would make these new licencees model hams. I think it would be a severe violation of the amateur fraternity to engage in childish stunts like appending your call with a /C. I will certainly welcome these new licencees to the hobby enthusiastically.

Just my opinion....

1. Disconnect external speaker.
2. Connect wires (twist) where mic element connected.

2. Talk into speaker.

It's worked for me. Sounds a little boomy, but what the hey.

Encoding: The translation of intelligence into a form suitable to be
          transmited. Here the encoding of words formed from the English
          Alphabet into Morse Code bi-state timings.

Modulation: The method of impressing an encoding onto the medium. Here
            the use of variable length on-off keying, a form of AM pulse
            modulation. Morse could be sent using FSK modulation with the
            marks corresponding to an "on" state and spaces corresponding to

the "off" state, it would work better under selective fading due to the extra redundancy.

>As for CW being an AM mode, that's a bit of a stretch. While CW takes
>on two amplitudes there is no information in the amplitude itself.
>Also, the sidebands are zero-width.

Not true. The two amplitudes (on and off) along with the duration of the pulses *are* the modulation that, after demodulation, can be decoded back into the original intelligence through the use of a Morse Decoder. The decoder can be organo-chemical or silicon-electrical.

The sidebands of on-off keyed signals are not zero. From the ARRL Handbook 1982 page 11-1, "On-off keying is a form of amplitude modulation and, as such, generates sidebands whose spacing from the carrier is proportional to the keying speed. A keying speed of 12 wpm corresponds to an information rate of 5 Hz, which theoretically requires 10 Hz bandwidth. A keying waveform, however, approaches square-wave modulation, consisting of the keying frequency plus all of the odd harmonics." This is why filters narrower than a couple hundred hertz can't successfully be used to copy CW. The bit edges become smeared (ringing) when all the odd harmonics are stripped off.

Remember that Morse Code is not the beeps that you hear, it is the duration and spacing of the waveform envelopes that carry the encoding.

I strongly support this alignment, especially changing rec.ham-radio to
rec.radio.ham.misc as this should cut down on inappropriate cross-posts.
I am also strongly in favor of a tech group where less heat and more light
can be thrown on such subjects as modulation methods and encodings. I
seriously doubt that legal will be widely read or posted to, but maybe
that's just as well.

EXCUSE ME?!?!? What do you think computers and fancy user interfaces are for? Even if I did have to type some long drawn-out newsgroup name, I'd probably just cut-and-paste it on my DMD with the mouse!

My Canadian Radio License says "AMATEUR". In my own eyes I am not a "ham". Period. I don't use the term (unless it slips out when I'm in conversation with others using it), and I don't like it. It grates on my nerves. I know many others who feel the same. In the real world it is just as easy to type, write, and say "amateur". It is more correct and proper to do so, and it doesn't convey nearly so many negative connotations. As you can probably tell it does make a big difference to me, and I'll guarantee it'll make a big difference to many potential amateur's in the USENET communitee.

I'm not advocating a ban of the term "ham", though, by any stretch of the imagination. I only want to be extra careful about not using it in prominent places like newsgroup names. It's a slang term (definition #4 in Webster's), and I've no objection to it being used as such in everyday speech. In my opinion anyone using it in written form, especially in more formal writing, is debasing themselves.

I do, however, agree with the .misc subgroup, and I've given up even thinking about .legal vs. .regs.

I still *strongly* prefer .digital over .packet. Packet is only one of the digital modes. In actual fact .net might be better for the future if we are to encourage proper networking.

Again my (slightly modified) proposal is the following:

```
rec.radio.amateur.legal
rec.radio.amateur.misc    (from rec.ham-radio)
rec.radio.amateur.digital (from rec.ham-radio.packet)
rec.radio.amateur.swap    (from rec.ham-radio.swap)
rec.radio.amateur.tech
--
```

Not rescinded, merely forgotten after people get used to hearing
the interim calls. If upgraded and not changing the callsign, the
interim call is no longer required.

I don't know about elsewhere, but there's a money exchange company called "Deak International" that has a kiosk at San Francisco International Airport. Last time I checked, they charged about $5 for a "sterling draft" for me to send to a british company that didn't do credit cards. Maybe other airports host similar businesses?

Tell that to avionics technicians! They still need it. When I took the test a year or so ago, the test-waiting-area was heavily populated by people who wanted to work for United Airlines, which has a large repair depot in this area. As for difficulty, I would put it at about the level of the Advanced. As people in the testing room finished their tests, they went up and were graded on the spot. Passes seemed to be running about 50%...

Of course, the General Radiotelephone isn't needed for a lot of things the FCC used to license, like repairing CBs, being a broadcast station engineer, etc. The general principle seems to be that the FCC doesn't want to license anyone that they're not REQUIRED to license by INTERNATIONAL TREATY. Hence they still issue ham licenses and Marine radio licenses. Its too bad, in a way. Now, if you want to work at a radio station, you have to prove your proficiency some other way, like a degree, or prior experience...

Different police departments use different codes. There is a "common 10-code list" in the Radio Shack "Police Call" book, but it will be somewhat different from whatever police department you monitor.

And that's a big ten-four.

Assuming I've interpreted your broken English correctly, you're
attempting to explain away my (and others) position on the classless

amateur radio license as an attempt to gain privileges without being qualified for them, specifically lacking "the answers to more theory".

While it undoubtedly makes you feel warm inside to have discovered the base and ulterior motives behind this attempt at reform, let me caution you not to feel too good about it - because you're wrong.

Let me remind you that when I and many others took the Technician license exam, the only difference between the Tech and General license WAS the code speed. The "theory" (and regs) part of the exam was exactly the same, which completely negates your argument about "few if any General" licensees.

And while I can't speak to the qualifications of other long-time Technician licensees (I don't know, and unlike you, I'm unwilling to condemn them without facts), it's not the theory that made the difference. If you require proof, I'll wave my 1st phone (with radar) license under your nose. I earned it a year or so after I got my Tech ham license - just after I graduated from high school. The jobs I held in industrial and broadcast radio required it.

Except for packet radio on two meters, you'll rarely find me below 420 MHz. I've little use for HF; the telephone works better and cheaper.

ARRL/VEC NEWS RELEASE   December 14, 1990

To: All ARRL VE Team Liaisons

From: Bart J. Jahnke. KB9NM. ARRL/VEC Manager

FOR IMMEDIATE RELEASE

FCC CREATES CODELESS CLASS OF AMATEUR RADIO LICENSE

For the first time ever, starting in February it will be possible to obtain an Amateur Radio license in the United States without passing a Morse code test. This was announced by the FCC at its open meeting yesterday, December 13th. The Federal Communications Commissions (FCC) has eliminated the need for new Technician class Amateur Radio license applicants to demonstrate proficiency in Morse code in order to have all amateur privileges above 30 MHz. The implementation date may be as early as February 1991. Technicians who obtain their licenses prior to that date will be grandfathered, meaning their existing HF privileges will continue.

The codeless Technician written examination will have 55 questions (existing Elements 2 and 3A). New Technicians wishing to gain access to the HF privileges below 30 MHz will be required to pass the Element 1A (5 WPM) Morse code test before three Volunteer Examiners accredited by Volunteer Examiner Coordinators, and will be given a Certificate of Successful Completion of Examination (CSCE) to serve as evidence of their qualifications. That CSCE must be retained by them in perpetuity to prove they have met the requirement to gain access to the Novice HF bands. Novices wishing to upgrade to Technician must pass Element 3A to gain the VHF privileges of the Technician class. Novices will need to retain a copy (preferably the original) of their Novice license in order to show that they have met the 5 WPM requirment for HF band access. This is because there will be no call sign designator to indicate Technicians who have or have not passed a code test. VECs will supply the FCC with a list of those codeless Technicians who passed element 1A.

There has been no change to the Novice license in any way, nor has there been any change made above the Technician class. Novice examinations will continue to be available both by two Novice examiners (no test fee), or by three accredited VEs (no test fee if only elements 1A and 2 are involved). The FCC decided to retain the current Novice Class operator license as an alternate entry level license for those persons able to pass the 5 WPM Morse code test instead of the more comprehensive written exam required for the Technician Class license.

At a press briefing held just after the Commission's meeting, FCC Private Radio Bureau Chief Ralph Haller said "The Amateur Service is not growing as it should relative to what it has to offer." He said that the Amateur Service is where our nation's technical expertise comes from--that the changes should attract people who are interested in computers and digital communications, and should help the US to become more competitive.

In a news release today, ARRL President Larry Price, W4RA noted with pleasure that the Commission had decided to retain the Novice license as a means of entry into Amateur Radio and to adopt a codeless license with a meaningful written examination requirement. "Our members were very strong on both of these points, because they couldn't imagine how we could maintain the character of the Amateuer Radio Service without them," Mr. Price said.

Presiden Price sounded a note of caution with the privileges the Commission plans to grant codeless licesees. He indicated that the formula developed by the ARRL Board, which called for privileges above 220 MHz, was based upon extensive membership input. It was carefully balanced to offer attractive privileges while protecting existing patterns of amateur activity. While it will take some time to gauge the reaction to the Commission's action, Mr. Price observed that the FCC formula is likely to be less acceptable to many amateurs than the League's. He asks that League members share their views with their elected Directors, who will collectivly determine League policy.

"Before we can decide whether to request that the Commisson partially reconsider its action, we'll have to see the Report and Order," said Mr. Price. Usually it takes the FCC from several days to several weeks after a Commisson action to release an itemn after editorial review. There is a 30 day window of opportunity following release in which petitions for recondsideration can be filed. Mr. Price noted that ARRL Board was holding its regular meeting on January 18-19 1991. "The timing looks good for a careful review of the Commission's action at that meeting," he said.

MORSE CODE EXEMPTIONS FOR HANDICAPPED OR DISABLED AMATEURS

FCC also announced yesterday that it has amended its rules to make the Amateur Service more accessible to the handicapped or disabled licensees who are unable to pass a higher speed Morse code examination.

The FCC decide to declined to provide a list of disabilities; instead, the judgment of a qualified physician will be relied on to detrmine that a person cannot pass a Morse code examination due to a severe handicap.

In response to concerns about the integrity of the process, FCC staff said anyone abusing the process would be dealt with harshly.

The FCC afirmed that because of international requirements, no examptions would be granted for the 5 WPM Morse code requirement.

As we understand it, Element 1C credit will be given by VEs to applicants presenting a correctly completed DOCTOR's CERTIFICATION. The FCC indicated that the physician will be relied upon to make the appropriate certification and that the certification will include permission for release of mediacal information to the FCC. Ralf Haller. or the FCC, said that the 610 form may be modified to require the certifying physician's signature on the form near the US Code Title 18 Reference which states. "Willful false statements made on this form or attachments are punishable by fine and imprisonment."

More specific information will be provided to you though the next VE

EXPRESS newsletter upon receipt of the Report and Order documents on
both of the above news items.

>As for CW being an AM mode, that's a bit of a stretch. While CW takes
>on two amplitudes there is no information in the amplitude itself.
>Also, the sidebands are zero-width.

I'd like to give this issue a stab. The modulation of RF refers to what you do to the base RF signal. For instance, start with a constant amplitude RF signal and chop it on/off (a la CW). This is an AM mode, since any information is being conveyed via amplitude changes. The modulating signal is digital in nature, since it consists of on/off pulses. (one could claim CW is a combination of pulse-position/pulse width modulation, but I digress). If you take the same digital on/off signal and apply it to a tone generator and feed this into an FM transmitter, you get an FM style mode. In this case the carrier is on all the time, and the information is contained in the FM sidebands. A real-life example of a complex waveform is the APT format sent by wx satellites. The RF transmission is medium width FM, but the modulating signal is an amplitude modulated 2400Hz tone that represents image data. The confusion arises in that for HF packet you use two tones to encode your HDLC data, but feed them into a SSB transmitter. What you get it still a SSB signal, but the encoding of the data is indeed frequency modulation (also known as frequency shift keying, FSK). If I were to choose a single tone with two distinct amplitude levels as my input to the SSB transmitter, I'd still have a SSB signal on the air, but the encoding of your HDLC data would now be AM in nature. I hope this helps clear things up.

I finally made the contact with U2MIR, signal was a 57 to 58 and lasted about 45 seconds. Contact time was 1330 UTC. I was in the car and almost froze upon hearing the comeback. He gave me a 57 as a signal report.

I was using a Kenwood TM731A (45 watts) to a Larson 5/8 dual bander

Here is the data available on the pass

I am but a *voyeur* of these conversations about ham radio, and only occasionally that. As an *old-timer* (W4DHK since '54) the passions aren't what they used to be; and they are spread over a lot of other areas of interest, activity, and concern. I am still somewhat involved - having sat for my Advanced and Extra class tickets last Spring, gone to a couple of *Hamfests* (why is that always so depressing?), and bought myself a new HF rig and keyer. Whoops.....hope that doesn't tip my fist....er....hand....as to what my position might be IF I were to join the debate about no-code licensing.

Actually, I really don't have a position on no-code. I see the passionate exchanges and find myself on both sides of the issue from time to time. There have been basic changes over the years which DID upset me, and which DID, I believe, have a detrimental impact on the service. But not this one. No-code was inevitable. No-theory tickets are not that far fetched, nor are they, IMHO, that far away. It really doesn't matter what you or I think is appropriate, or what is happening with the service and/or technology. The process has much more to do with economics, and with evolutionary trends in our society. You know what happened in commercial radio, and on the Citizen's Band. Take a look at some of the other federal agency certification processes; see what the FAA is doing, for instance, with the *pilots* license.

Telegraphy, I think everyone agrees, is an integral part of the history and tradition of ham radio. I have always enjoyed that aspect of the hobby a lot, and I feel that I always will. I have less fun with, and less need for, circuit design principles and formulas, and advanced electronic theory - having designed my first and last rig in 1954. But that is also an important aspect - more challenging and dynamic for sure; and I want to be competent in that area too. I don't *need* the electronic theory to be an amateur radio communicator - at least in the way that I enjoy it. And I can appreciate that others do not NEED code for what they want to do. But....come on....it is all so incredibly EASY! Why would anybody let any of it keep them out of this hobby?

I am an Academic Computing consultant at the University of Ky. My life has nothing to do with telegraphy OR electronics. And I was able, with modest effort, to pass the novice, general, advanced, and extra class exams - all on the first try; the latter two with perfect scores. Many of you, I know, have done the same. Any person with normal intelligence, a current ARRL study guide, and a low-end pocket calculator can prepare for and pass any FCC written exam. Throw in a little commitment and positive attitude and the code is just as easy. I have taught enough of it to know; anybody who wants to can learn it. Anyone with the right attitude, a little commitment, and no particular learning disability, can become proficient. *Hazing* seems such a strange way to perceive such a trivial prerequisite. I remember when people used to talk about how stupid and unfair it was to have to learn about *radios* and navigation equipment and all that other dumb technical stuff - just to get a license to fly an airplane. They didn't want to study and practice (be hazed); they wanted to get out there and FLY! Well.....guess what folks; Now they can! Don't worry though. The special rules they operate under SHOULD keep them out of your airspace, and off of your approach paths - in most cases.

I say *welcome aboard* no-coders. Hope you enjoy our hobby and our fraternity, and that you continue to explore and discover and broaden your horizons.

I, too, think packet on CB radio would be an excellent idea. For several reasons...

(1) The ban on business communications in ham radio is somewhat awkward. Amateur *computing* usually mixes business and hobby together. It's hard to separate them cleanly enough to satisfy ham requirements. (Such things as not sending shareware through the air.)

(2) Packet rigs have enough patience to out-wait even the most determined jammer or ratchetjaw.

But I'd rather get FCC approval first. And I'd like to use FM; perhaps we should petition the FCC to allow FM packet on CB?

Well, *tell* us, Joel: what did you talk about for 45 seconds???! Do you speak Russian, or is Musa fluent in English?

I'm envious. When I worked U4MIR, I'd been practicing saying "Mna zavoot Patty" for two days, but I got drowned out by someone else when I said it! Granted, exchanging callsigns was enough to get me a MIR QSL card, but I would've liked a little more.

Patty

p.s. Is their frequency 145.550 or 145.555? I can never remember.

I don't think the code has helped me "learn good operating practices." In fact,
beyond taking the code test to get my Novice, I have not used the code at all.
I was communications officer for my CAP squadron years before I got my first
Novice ticket (20 yeares ago). I was sent to the Air Force Communications
School at Keesler AFB were I learned all about conducting Nets and procedures
for point-to-point ground communications. All using SSB and no code.

>
I always enjoy making new friends over the air. Since one of my favorite
modes is packet, I have spent hours sitting at the keyboard chatting with
folks I'll probably never meet any other way. Perhaps I may even have the
opportunity to chat with you, too. There are so many aspect to ham radio,
find the ones you like and excell in those areas. I don't care for CW, but
that is my personal choice. If someone else likes CW but not packet, that
is fine too. I don't condem anyones choice of operating mode nor do I
expect them to condem mine.>

Mike Waters AA4MW writes:
>And how many people know what class "AA4MW" is? You would be suprised at
>the number of people who have gotten it wrong!

Let's see. 2x2. Must be an ADVANCED call!

Have you considered changing to a 7 call? I hand picked AA4KB back in '78
(AA4 Kick Butt -- it's a contester slogan) and I've been really loathe to
change for a local Extra call. Now I'd get AB6xx. Bleh. But, damn, I
do get tired of people asking me how long I'm going to be visiting California,
and in the Sweepstakes, I simply _had_ to sign AA4KB/6 so they would copy
SCV and not SC.

But naaaaaah! I'll stick with it. I held another great call: N6DE. When
I moved home to Memphis, and thought it would be permanent, I traded it in
for AA4KB (second choice to AA4TN). I would operate in the contests as
N6DE/4 ... and NOBODY could copy it!

"AA4MW DE N6DE/4 AR"   "/4?"

Now that I'm home in California (since 1980), I'd DEARLY love to get N6DE
back. <sigh>

{
{This is also the justification for fraternity hazing, parental
{discipline tactics, etc. It's basically saying "its that way because
{its always been that way." It's a common societal tendancy.

True, my grandfather spent much of his childhood learning penmanship in a
"good round hand". We don't seem to be as fussy about that now for some
reaason ...

{Anyway, I've pretty much decided that 5WPM is trivial, and once I've

True, 5wpm really IS trivial. That is part of the argument for deleting the
requirement on VHF in fact.

{got equipment tempting me to operate <30MHz I'll probably _upgrade_
{to Novice (so to speak). I will probably never operate CW without the
{aid of a computer to en/decode; it just doesn't interest me. (OK,
{maybe occasionally trying to understand random morse I hear somewhere...
{but it's not something I would try to get _good_ at!)

I hope you will take a closer look at manually copied CW though, it really
IS a good mode and a lot of fun. Not quite as wonderful as some on this net
would have you believe, but still fun. (The word LID was contrived for CW!)

{Please note: Code/NoCode is a heated issue. Please don't flame me,
{and if you must, please do it on email.

Not intended as a flame, just a comment.

{P.S. Is the salutation '73' from the median impedance of a dipole?

No, in fact the term predates "72" ohm dipoles by about a century. The
actual origin is unknown as far as I am aware, but has been the subject of
some very entertaining speculation.

They sure are courteous. One evening I was listening to the SSTV guys on
20 meters (I don't have SSTV capability) and one of them said,
"Now if anyone watching is offended by nudy pictures, then just
turn off your monitor now." And then he transmitted a picture.

They sure are courteous. #|^>

>that the Amateur Service is where our nation's technical expertise
>comes from--that the changes should attract people who are
>interested in computers and digital communications, and should help
>the US to become more competitive.

Wow. An FCC that is more enlightened than the League that
represents us! Do you really mean that us folks who still see
Ham radio as a technical hobby do have a friend in Washington?

>In a news release today, ARRL President Larry Price, W4RA noted
>...
>"Before we can decide whether to request that the Commisson
>partially reconsider its action, we'll have to see the Report and

>difference.

As another "tech lifer", I'll throw another voice into this one.

>If you require proof, I'll wave my 1st phone (with radar)
>license under your nose.

Same here. I've always looked down upon hams that did not prove their merit by also earning a 1st commercial. (not really, but that statement kinda shows how ignorant the code booster sound.)

>I earned it a year or so after I got my Tech
>ham license

I took my Technician test, my 3rd, 2nd, and 1st tests all in the same day. I considered my ham ticket just a license to talk; I considered my 1st an achievement.

>Except for packet radio on two meters, you'll rarely find me below
>420 MHz. I've little use for HF; the telephone works better and cheaper.

Same here. At least at UHF, you don't have too many bARFbags floating
about.

I guess the best part about all this noise about no-code licenses is that
it does not matter. WE won, you lost and I'm going to savor the victory
for some time to come. That is until I get motivated to start working
for the total elimination of CW as a license requirement.

A toast to all those who worked so hard to make it happen!!! Let's do it
again.

John

I am interested in purchasing a YEASU FT-757 GX II radio. I like its small size, General coverage receive, and the fact that it comes with AM & FM built in. In addition, I like very much that the SQUELCH control is active in all modes, not just FM.

If anyone is interested in sending me comments concerning this radio, I would appreciate it. In addition, anyone with comments concerning other brand radios with basically the same features in the same price range (about $850) are certainly welcome to voice their opinions.

Thanks in Advance

>When the output stage is "OFF", there is no current through it, so again
>P=EI=0. In reality, of course, the "ON" resistance is never zero,
>and the switching time is never instantaneous, so the efficiency is
>not 100%. I believe actual efficiency is a strong function of the
>topology of the output filter network.

Class D power amps use push pull or complementary transistor pairs and require only a simple series resonant output filter. A CMOS digital line driver ought to make a nifty Class D QRP final. (I have some drivers on order; if anything interesting comes out of it I will post and maybe write up a magazine article.)

Class E power amps are single ended and require a C-L-C output network with very particular reactance values. I found information on these in a book called "Solid State Radio Engineering". I have played with these using power MOSFET's at 184 kHz and measured 90+ percent efficiency. It is really tough to get fast enough transitions for good efficency at HF.

Consider a AM transmitter that has a Class D or E final and a switching mode modulator. About half the DC in comes out as energy in the sidebands. Now consider a SSB transmitter with a 50 percent efficent linear final. Half its DC in comes out as power in the 1 sideband. The received signal to noise ratio (neglecting QRM) will be the same for any given amount of DC power in. The AM system wins because the transmitter doesn't get hot and the receiver can be simpler. Fidelity is better, too. (This is all at the expense of twice the transmission bandwidth, of course.)

ARRL Letter Volume 9 Number 24 November 29, 1990 - Page 1 of 5

MEMBERS CHOOSE NEW DIRECTORS

ARRL members in the Northwestern and West Gulf Divisions have voted to send new representatives to the ARRL Board, and in the Hudson Division have returned the incumbent to office for another term. Ballots in these and two other contested elections for 1991-1992 terms of office were counted by the Committee of Tellers November 20 at League Headquarters.

The Northwestern Division race was between Mary Lewis, W7QGP, the present ARRL Section Manager of Western Washington and a past Director of the Divison, and incumbent Bill Shrader, W7QMU. Shrader advanced from the position of Vice Director to Director a year ago following the resignation of Rush Drake, W7RM, for health reasons. Lewis was elected by a margin of 110 votes, 2,382 to 2,272. The incumbent Vice Director, Mary Lou Brown, NM7N, was unopposed for reelection.

In the West Gulf Division, the incumbent Director, Sam Sitton, KV5X, had moved up to that position from Vice Director in January following the election of Jim Haynie, WB5JBP, as an ARRL Vice President. Tom Comstock, N5TC, a past Vice Director, had been appointed to fill the Vice Director vacancy. For the new term, however, Sitton decided to run for Vice Director and was elected without opposition. Comstock ran for Director and was elected over Rik Albury, W5SOQ, by a margin of 2,641 to 1,234.

In the Hudson Division, Director Steve Mendelsohn, WA2DHF, was returned for a third term. In a replay of the 1988 election, Mendelsohn bested Vincent Biancomano, WB2EZG, 2,898 to 1,235. Vice Director Paul Vydareny, WB2VUK, was unopposed for reelection.

The other contests this year were for the Vice Director positions in the Rocky Mountain and Central Divisions.

In the Rocky Mountain Vice Director contest, where the incumbent was not seeking reelection, Bob Scupp, WB5YYX, defeated past Director Lys Carey, K0PGM, by the narrowest margin of the year: 948 to 925. Director Marshall Quiat, AG0X, was reelected without opposition.

In the Central Division, in the only three-way race of the year, incumbent Vice Director Howie Huntington, K9KM, defeated challengers Mike Hoshiko, W9CJW, and Ken Ebneter, K9EN. The three received 2,231, 1,065, and 928 votes respectively. Director Ed Metzger, W9PRN, previously had been declared reelected as the only eligible candidate.

The newly elected League officials take office at noon January 1, 1991, along with the Directors and Vice Directors previously declared elected without opposition in the New England, Roanoke, and Southwestern Divisions.

W1AW TO SHIFT 15 AND 10 M CW FREQUENCIES

Effective January 2, 1991, W1AW will transmit its code practice and CW bulletins on new frequencies in the 15 and 10 meter bands. The change is being made to avoid interference between W1AW and AMTOR operations, which have become very popular near the old frequencies that had been used by W1AW for many years.

The new frequencies will be 21.0675 and 28.0675 MHz, 10 kHz lower than the old frequencies.

HAMS HELP TRACK ANOTHER ALLEGED JAMMER

Another alleged radio jammer has been silenced due in part to the efforts of Amateur Radio operators. On November 6 U.S. marshals and engineers from the FCC's Langhorne, PA field office seized radio equipment, belonging to Ernest Woods, 30, of Norristown, believed to have been used to interfere with Philadelphia-area 2-meter Amateur repeaters, as well as frequencies of the Pennsylvania State Police, the Norristown fire department, and other public service agencies.

Woods could face serious civil and criminal charges as a result. Woods was issued Novice class amateur license KA3WHZ in May 1990 and a Technician license in August.

In late June users of the Telford (PA) Area Repeater Association (TARA) began to experience "persistent and purposeful interference" to their 145.190 MHz repeater. In early August the TARA executive committee and TARA's control operators met to discuss the situation, after the jammer had gotten access, apparently through trial and error, to the repeater's phone patch and speed dial codes.

Concerned for the integrity of the repeater's emergency service codes, TARA on August 8 changed these services to "controlled access," and at the same time began efforts to pinpoint the source of the interfering signal. Standard Amateur fox-hunting techniques soon narrowed the source of the signal to a neighborhood of Norristown, about 20 miles from downtown Philadelphia.

On August 27 a preliminary formal complaint--with tape recordings--was filed by TARA's president with the Engineer in Charge of the FCC field office in Langhorne, PA. Area ARRL and repeater officials were at that time notified of the situation.

On September 2, a team once again tracked "Barney," as they called the jammer, and concluded that additional equipment would be needed to positively identify the specific house from which the signal was being transmitted.

On September 6 a TARA official and one from the Fairview Village 2-meter repeater joined forces, using a Doppler Systems direction finding unit to localize the source of the signal to the same area.

Four days later, a station wss copied interfering with several Pennsylvania State Police channels in the 159-MHz range. A TARA official monitored the police frequencies long enough to confirm to his satisfaction that the interfering operator probably was the TARA repeater jammer.

TARA informed the Pennsylvania State Police of their on- going search for their repeater jammer, and were told the cops had been forced to move to alternate frequencies because of the jammer.

As word spread through various agencies, interference to the state police continued, with Barney telling the troopers to "drop dead" and at one point making a false report of an accident.

By Sept. 12 the FCC had stepped in, to act on complaints both from TARA and from the state police. Engineer-in-Charge John Rahtes asked for TARA's assistance: Rahtes needed a safe house in the immediate neighborhood where his agency could set up equipment to monitor the jammer, identify him, and gather legal evidence.

A vacant third floor apartment was located a half-block from the suspected source of the signal and the FCC installed its equipment, including gear capable of identifying transmitters by their signal signatures. TARA personnel assisted the FCC in monitoring over the next few weeks.

. . . . Continued next part

HAMS HELP TRACK ANOTHER ALLEGED JAMMER - (Continued)

"Barney" feels the heat

Barney at this point apparently became suspicious and for several days curtailed his transmitting.

Additional transmissions were noted on the TARA repeater, and on state police, county radio, and the Norristown Fire Department frequencies, as Barney gradually resumed operations beginning the weekend of Sept. 15-16. FCC engineers meanwhile narrowed the source down to a particular house in the congested area.

For the next two weeks monitoring increased, as efforts began to identify the occupants of the house, which appeared to be divided into apartments. Any search warrant issued would have to be for a specific apartment rather than for the whole building.

At the end of September the U.S. Attorney was presented with evidence gathered up to that time. Montgomery County Communications Chief Dennis Parker and Norristown Fire Department Chief Joe DeDominic were asked to provide evidence they had gathered about interference to their operations and to file formal complaints.

In early October the jamming increased, and included harrassment of the Norristown F.D. on Oct 20, 23, and 26. In one transmission Barney tried to recall several trucks from a fire call. By that time the fire department had filed a formal complaint with the FCC.

On Oct. 19, U.S. marshals and FCC personnel, acting on a search warrant issued by the U.S. Attorney, entered the suspect house. But no radio equipment was found.

Although the raid was a disappointment, the FCC continued its probe. The landlord of the row house next to the house that had been searched told Rahtes that one of his tenants was known to have several radios and antennas in his room at the front of the building. The landlord supplied additional information, such as the tenant's work hours, which seemed to confirm that this individual was indeed the likely suspect.

From the landlord's first floor apartment Rahtes took field strength measurements, and was able to hear Barney operating his equipment through the thin walls of the building.

On Nov 1, the Radio Amateur Civil Emergency Service repeater in Eagleville, PA, reported unauthorized access to its 911 emergency system. RACES net members were being beeped day and night, adding to the FCC's case for securing another search warrant, which soon was issued.

TARA president E.C. "Gene" Pressler, W3ZXV, joined FCC personnel and U.S. marshals to enter the suspect premises. Several pieces of radio equipment were discovered, along with a directional antenna suspended from the ceiling, and other evidence.

Pressler then operated the suspect's equipment as FCC engineers Barry Peahota and Frank Hurst made recordings of the signal, for later signal and voice print analysis comparison with taped jamming transmissions.

Included among the equipment confiscated were two hand-held transceivers, as well as several scanners, most of which were in operation at the time of the search.

At presstime, no charges had yet been filed against Woods.

FCC TWEAKS AMATEUR RULES

The Federal Communications Commission has addressed a number of proposals for changes to its Part 97 Rules for the Amateur Service, in response to petitions by the ARRL as well as several individuals. The Commission's Notice of Proposed Rule Making in Docket 90-561 was released Nov. 16. Here are the highlights:

- The ARRL asked that the terms "telecommand," telemetry," and "space telemetry" be defined in the Rules; FCC agreed. The terms "tactical call sign" and "digipeater" will not be codified.

- ARRL sought an increase in the minimum number of club members necessary to apply for a club station license, from two to four. But the Commission noted that no new club station licenses have been issued for some 13 years and "we do not foresee that we will resume doing so," so the point was moot. The League continues to urge the Commission to resume the issuance of new club station licenses.

- FCC declined a request to amend its Rule that states an Amateur station must be independent of all other radio apparatus installed on a ship or aircraft. The League's argument in this case was that a regulation already is in place prohibiting an Amateur signal from interfering with other apparatus aboard.

- In the matter of prohibition of automatic control of Amateur stations when third party traffic is being handled, the League sought a rules revision to put the responsibility for the content of such traffic on the originating Amateur station. The Commission, however, maintained that traffic content is the responsibility of every station, including those who retransmit communications, and proposed no change.

In a related matter, ARRL sought a clarification of Section 97.109(d), to emphasize that a Commission representative may order an automatically controlled station to shut down because of improper operation or harmful interference only after the alleged offending station has been given the opportunity for a hearing.

FCC denied this, saying that "the control operator must cease automatic control of the station upon notification by an Engineer in Charge that the station is transmitting improperly or causing interference to other stations, and the licensee is not entitled to a hearing before such notification."

* The FCC declined to amend its Rules to permit retransmissions of other services--NOAA weather and DOC propagation broadcasts--saying such transmissions are "routinely available over the air with inexpensive receivers."

* The FCC agreed to amend its Rule regarding compensation of club station operators, lowering the number of simultaneous bands on which bulletins and code practice must be transmitted from ten to six.

* A request to ease the FCC Rules regarding third party communications on behalf of someone holding an Amateur Radio license but not eligible to be a control operator of an FCC- licensed station was denied. The Commission said this had already been considered (in the most recent Rules rewrite) and denied at that time.

* A request by an individual Amateur to require stations to identify at the beginning of communications through a repeater was not included in the proposals, but FCC asked for comments in the matter.

* FCC declined to entertain a change in its Rules to incorporate due-process procedures in cases involving "quiet hours," saying that it was unnecessary.

* In the area of Special Operations, FCC agreed to:

1. Amend its Rules to delete the condition that an auxiliary station can be automatically controlled only when it is part of a repeater system, so that Amateur operators can experiment with new system configurations that use auxiliary links;

2. Expand the permissible types of space telemetry transmissions as requested by the ARRL;

3. Make minor changes in wording, including changing "remote control" to "telecommand."

* The FCC once again refused to change its Rules banning 10-meter power amplifiers, saying the ban "makes our enforcement procedures more efficient and effective."

* A request that persons whose Amateur station or operator license has been revoked or suspended be allowed to qualify as a volunteer examiner after a 10-year period was turned down.

Interested parties may file comments on or before Jan. 31, 1991; reply comments are due by March 4, 1991. Extensions of time are not contemplated, according to the FCC.

NEWS FROM CANADA

- The Canadian Radio Relay League and the Canadian Amateur Radio Federation met Oct. 14 to discuss a merger of the two groups. A draft constitution for a new, single Canadian organization was updated based on comments from boards of directors of the two bodies. The merger committee plans another meeting early in December, and tentative plans were made for the CRRL board and the CARF annual general meeting to be held "in a common location" in June, 1991.

- It may take a massive letter-writing campaign to Canada's Department of Commerce to get the new "Client Procedures Circular" rescinded, according to CRRL. The CPC, which will be published in its entirety in the December issue of QST Canada, is subtitled "Municipal Consultation on Non- Broadcasting Antennas," and is characterized by CRRL as "so poorly crafted that it lends itself to all kinds of interpretations and arbitrary decisions."

- Regarding new (as of Oct. 1) Canadian regulations based on the bandwidth of transmitted signals, that 1200-baud packet operation falls within the 6-kHz maximum bandwidth allowed on 160-12 meters (except 30 meters). CRRL and CARF ask that Amateurs NOT use 1200-baud packet on the HF bands "until the CRRL and CARF form a band planning committee and the matter has been studied."

CONFERENCE HONORS ARMSTRONG

Edwin Howard Armstrong, "the Major," would have been 100 years old this year. The centennial of his birth has spawned a number of projects and retrospectives, the latest of which was a conference held Nov. 16 at Columbia University, his alma mater and where for many years he was a faculty member.

Attending the conference, held at the Columbia Center for Telecommunications and Information Studies in New York City, was ARRL Executive Vice President David Sumner, K1ZZ. Sumner participated in discussions of papers presented at the conference, particularly those concerned with the commercial development of FM (which Armstrong invented) in the U.S.

Maj. Armstrong was widely regarded as having strong roots in Amateur Radio. Although his experimentation as a "ham" predated licensing, Armstrong helped build and operate the Radio Club of America station 1BCG that was the first to be heard by the League's Paul Godley at

Ardrossan, Scotland, in 1921.

It was just this sort of unstructured, "amateur" experimentation that Armstrong carried over into his many technical breakthroughs, which included invention of the regenerative circuit (1912); the superheterodyne (1917); and wide band FM (1933).

Also present at the conference was Thomas Lewis of Skidmore College, who is helping produce the film "Empire of the Air," a PBS documentary about the early days of broadcasting that is scheduled for airing next fall. Lewis is pictured with Bruce Kelley, W2ICE, in the Oct. 19 issue of The ARRL Letter.

PLEASE GO AWAY

Here is the latest list of intruders in our HF bands which the ARRL has asked FCC's Treaty Branch to pursue with other countries as well as our own:

* 1813-1820 kHz, A2A (beacon transmitters);
* 7008, F1 (TTY idling and traffic);
* 14221, R7B/F1B (250/500 Hz shift TTY and Mux);
* 14312, F1 (high speed digital keying, 1 kHz shift);
* 18090, F1 (140 baud encrypted, 500 Hz shift);
* 18095.5, F1 (idling signal, 2 kHz shift);
* 18125, F1 (50 baud, 400 Hz shift, some encryption);
* 18138.5, F1 (140 baud, encrypted).

BRIEFS

* The League's latest move against the reallocation of part of the 220 MHz band to commercial interests was played out in court Nov. 16, when oral arguments were presented by the ARRL as plaintiff and the FCC as defendant, to the U.S. Court of Appeals, D.C. circuit. A panel of three judges heard the arguments and questioned both sides in the request for judicial review. The Court's decision is expected in a few weeks.

* The preliminary position on the 40-meter band contained in the FCC's Second Notice of Inquiry in Docket 89-554 generally was supported at the final 1990 meeting of the FCC WARC-92 Advisory Committee's Informal Working Group No. 1, held in Washington Nov. 8, according to EVP K1ZZ, who attended as a member of the working group. Background on this can be found in the Oct. 5 issue of The ARRL Letter and in Nov. QST.

As quoted from <9012192258.AA00358@tilde> by dube@cpdvax.csc.ti.com:
+---------------
| memorize. Check it out. Round up 25 ticket-holders and give 'em a
| no-notice exam for their class of license. See how many pass.
+---------------

I would.

+---------------
| CB-ification will have been achieved. Can't happen, you say? Well, they
| said a No-Code Ham license would never happen several years ago. Never say
| Never.
+---------------

The theory is still relevant. Show me that Morse code is absolutely essential knowledge in order to be able to operate *all* amateur modes and I will concede the point.

The theory should not only be retained --- it should be enhanced. Updated to reflect the "leading-edge" we're SUPPOSED to be on. Made even more relevant. And the ancient CW requirement should really become a series of endorsements for *all* amateur modes: the existing CW exams, low-speed HF/VHF packet, high-speed packet, SSB, FM, SSTV, ATV, RTTY, AMTOR, SS, ... License upgrades would be based on earning a certain number of endorsements, e.g. Novice requires one endorsement, Tech two, General four, Advanced six, Extra eight. (Example only, the actual endorsements and requirements should be set by the FCC and ARRL or etc. working together.) Frequency privileges would be based on band plans and endorsements: someone with HF/VHF packet would be permitted to operate packet in the frequency ranges usually used for such, etc. Such frequency privileges and other limitations would also be based on the theory exam, so that e.g. you still need Tech theory to use high power on VHF and General theory to use it on HF, etc.

I *still* don't expect to see it happen. But I can hope. It's time amateur radio came out of the 1920s or thereabouts, don't you think?

Another "Amateur radio is CW and vice versa" posting by rec@chiton.ucsd.edu
(Richard Currier):
+---------------
| Unfortunately this is not true. If you don't operate CW, build CW rigs, talk
| to DX OPs that run CW you can't know what is going on out there. You don't know
+---------------

If you don't operate SSTV, build SSTV rigs, talk to DX OPs that run SSTV you
can't know what's going on out there. You don't know what you are missing....

C'mon, already. Your so-called argument is equally applicable to all other
amateur modes, so it doesn't prove that CW is the GOD MODE.

And yes, I *have* heard liddishness on CW. Less than I've heard on HF SSB,
but more than I've heard on packet. I should thereby conclude that packet is
the best mode?

Would you please stop kidding yourself and recognize that CW is *one* mode of
many, not the Lord Highest God Of All Radio Modes Now And Forever, Amen?

Lines: 27

As quoted from <49@bootsie.UUCP> by olson@bootsie.UUCP (Eric Olson):
+---------------
| I'm confused. Forgive me if this is a dumb question.
|
| The question list I have has elements 2A,B,C,D,E,F,G,H,I;
| 3A,B,C,D,E,F,G,H,I; etc. I see references to Novice being
| element 2, and the codeless tech being 3A, or 3A and 3B.
+---------------

The tests themselves are Elements 2 (Novice), 3A (Tech), 3B (General), 4A (Advanced), 4B (Extra). Each test has a specific number of questions drawn from each section of the appropriate Question Pool.

The Question Pools' sections are *also* labeled; it is those labels you are looking at. A given question is identified by the test, question pool section and subsection, and question number within the subsection. Thus, we have question labels like "4AD-6.1", indicating test 4A (Advanced theory), section D, subsection 6, question 1. By and large, the questions in a given subsection are all rephrasings/reverse presentations/etc. of the same basic point of theory or law.

I wish it were possible to end the debate now, but the president of the ARRL is talking about petitioning the FCC to reconsider, and reduce the privileges of the no-code Technicians. (Apparently, there is a 30-day period after any decision during which petitions for reconsideration can be submitted.)

Write to the ARRL (don't just flame here!) if you object to this.

The FCC has not announced any change in callsign format. The new license will be a Technician license and will have the same kind of callsign that Technician does now.

Two other things may cause confusion:

(1) The original proposal was for a new class called Communicator with 2x3 calls.

(2) In areas 4 and 6, all the 1x3 calls are used up and even Generals (as well as Technicians) now get 2x3 calls.

SB RTTYDX @ ALLBBS $RTDX1221B
RTTY DX Notes 3of3 12/21/90

RTTY DX Notes for week ending 21st December 1990
BID: $RTDX1221B
Part 3 of 3.

HP1XZD receives his cards via Panatronics S.A., Attn Bill Draper,
Box 2016, Balboa, Panama.

N4WFM/C6A says to QSL to Jeanie Duff, P.o. Box 40842, Reno, NV
89504-4942 USA.

FO5ED lives in Box 1746, Papeete, Tahiti.

VP2EE will QSL via KA3DBN, John L. Rouse, 2703 Bartlett Lane,
Bowie, MD 20715-3911 USA.

Notes of Interest:

PA3DUU will operate from Morokulien signing LG5LG (on the Swedish/Norway border. Yes we have put him back where he belongs. Thanks, Jules) from December 22nd until 29th. QSL to LA5DFA. There is no DXCC status for this place.

3W3RR will sign YA0RR from January 1st for a three week period. He will operate RTTY for 10 of those days and will QSL via DIMA, UT5RP. Romeo says that Spratley has been delayed until later due to the Afghanastan operation. Send any donations to NT2X, Edward

Kritsky, P.O. Box 300715, Brooklyn, NY 11230-0010.

HA9RE and HA8XX will tour the South Pacific for the next 6 or 8 weeks
and will call at Chatham Island, Raratonga and Nuie Islands during
their itinerary. QSL via DJ1ND.

4X6UO says that from 30th December for 2 months 4Z80TA will celebrate
the 80th anniversary of the municipality of Tel Aviv.

We might as well put VE8RCS back in their right place on Ellismere
Island, which is more than 40km from the North Pole (geographically or
magnetic). But at least VE8XU is in Zone 1 (Thanks again Jules, I do
try to be perfect, but don't always succeed).

A Merry XMAS to you all. Don't eat too much.

GL DE DX1 (VK2SG).

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.
Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

Fancy user interfaces are for those who want to spend the extra money to buy the extra CPU power to run them. Some of us want our CPU's working on the problem at hand and not figuring out how to shade that button to make it look 3-d. Some of us understand the DELETE command, and don't need cute little pictures of wastebaskets. Some of those cute little pictures are so cute they don't convey any information at all, until you know what they are. If you have to learn what the picture means, why not just learn the command?

> My Canadian Radio License says "AMATEUR".

My U.S. one says Amateur, too. So what?

> I don't use the term (unless it slips out when I'm in
> conversation with others using it),

I don't use the term unless I use the term, either.

> and I don't like it.

I don't like the generic classification as amateur. When I do things, I don't try to do them in less than a professional manner.

> In the real world
> it is just as easy to type, write, and say "amateur".

Three letters are easier to type than 6 (different ones). Three letters are easier to write than 7. "Ham" is written as it is pronounced. "Amateur" has one of those odd spellings you need to memorize. Lessee -- amature? Amatur? Amatchur? Ham. Ham. Ham.

> It's a slang term
> (definition #4 in Webster's), and I've no objection to it being used
> as such in everyday speech.

At least "ham" HAS a radio definition, instead of the negative definition of the word "amateur" which completely ignores the radio usage.

> In my opinion anyone using it in written
> form, especially in more formal writing, is debasing themselves.

Is this another guideline for USEnet? USEnet is formal writing? Do you complain about the usage of "rec" for "recreation", and "biz" for "business"?

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

It would be a great place to transmit several hours of all 1990 W1AW
bulletins, DX notes, and propagation forecasts to date, followed by 20 wpm
code practice for Extras.

When you finish, turn the AMTOR loose chirping for a contact.

Jon Bloom would probably disagree. He thinks that the FCC should nitpick at us
for trivial violations whilst the taxicabs merrily ply their trade. However,
if you ARE cited, threaten the FCC with an appeal to the U.S. District Court,
charging the FCC is discriminating by enforcing the Communications Act
selectively and unequally.

Grrrr! I always wondered if te ARRL's support for no-code was a sham. Anyway,
I'm sending e-mail to HQ with CC: to Wayne and Fred.

I did. I wrote a letter to Larry Price and copied it to my Division Director and Section Manager (yeah, yeah, I know Steve is on the net :-). And I encourage everyone else, even those who are not Hams yet, to write. Since non-Hams may not read QST yet, the address to send your "Christmas cards" to is

Larry E. Price, W4RA
President, ARRL
P. O. Box 2067
Statesboro, GA 30458

I believe mail from potential Hams can be even more powerful than those who already are members of the ARRL. Get off your buns and write!

I told Price, in terms that bureaucrats may understand, that any reduction in the privileges for the newcomers would leave them with less that a favourable impression of the ARRL once these new folks get their licenses. What I didn't tell him was he would be lucky if any of these folks would even consider joining the ARRL if they had been screwed by the League.

I am particularly p*ssed because what the FCC did was probably the most intellegent thing I have seen a government agency do. And petty ARRL is going to muck it up. In my short one page comment to the FCC in August regarding Docket 90-55 (probably on record somewhere in the dungeons of Washington; and I posted it on the net, too), I wrote

> Specifically, if the codeless class were to be administered examinations on theory and rules and regulations commensurate to that administered to the Technician Class operators, then there is little just reason why they should not be accorded the same right and privileges as a Technician Class licensee in the Radio spectrum above 30 MHz.

Except for a spelling mistake that I later caught (hey, what do
you expect from us furriners :-), those were the precise words I
used. The FCC went one better. They *called* this new class of
license "Technicians!" See why I am mad at the ARRL?

Hello Netters,

I have been looking around for a semi-current list of *active* low-orbitting weather satellites that transmit FAX (AM) on the 136/137 MHz band. I bought a copy of the _Satellite Experimenter's Handbook_ at the ARRL table at Dayton last spring, but the most current ones it had listed were *1984*! Well, of course, the book is (c)1985 so that is not to out of the ordinary. I am sure there is a list somewhere, but I was hoping someone on the net might have a current one in an electronic form as I would like to redistribute it to our local group of satellite experimenters.

If anyone one can help out by emailing to me, posting to the group, and/or pointing me to an FTP site or a printed version, I would be most grateful.
I have been using TRAKSAT from Paul Traufler (latest version 2.55 from the RPV Astro BBS [213/541-7299] - shareware) along with the Keplerian elements posted here and have had a great deal of success. I would like to get a "complete" list to program more channels into my PRO-2004.

Speaking of the PRO-2004 - does anyone have any recommendations for some sort of low noise pre-amp to improve the sensitivity of the unit? I know that it is not the most sensitive in the world, but I had read that a pre-amp could really help out. I am concerned about the introduction of images and spurs that pre-amps sometimes create. Anyone got any favorites?

Thanks in advance and Merry Christmas and Happy New Year!

73's,

Mark.

A gross generalization, a transmitter with "tuning knob thingies" will be more efficient than a no tune design. The obvious exception is a fixed frequency unit with a well characterized load. Since we rarely have that in amateur service, put the knobs back on. Especially for battery powered QRP, every little bit of efficiency counts.

Isn't it funny that we generally didn't need antenna tuners until the advent of "no tune" radios. Now we have to have another box to do what the knobs used to do on the radio, *and* often suffer more inefficiency in the process. It's not cheap to get a loaded Q of 10 when the driving impedance is 0.02 ohm, but it's usually worth it in terms of efficiency. The tough part is the inital stepup transform to an impedance where reasonably sized components can be used.

In my opinion the commercially made rigs went to no tune so they could push the price of the matching network into another box and make the radios appear cheaper and smaller while removing a design headache and producing a little marketing hype. We don't have to do that in our own designs.

> keep them out of this hobby?

Ah, but current licensees are a self selected sample of the population who found the code EASY, or beat their heads against the barrier for month after month because they were too stubborn to let it keep them out of amateur radio. We don't have good evidence that a large segment of the population doesn't find the code HARD to learn. We are now embarking on an experiment that will let us find out for sure. If our ranks don't swell with the new no code techs, then, at least we'll know for sure that they weren't being kept out by the code being hard for them to learn. Then we'd have to take a very hard look at our hobby and try to figure out what makes it so unpopular with the public other than the code requirement. I have some ideas about what's wrong with the hobby other than presumed archaic licensing requirements, but let's wait and see before starting another crusade.

Some of the real experimental work going on around here is with full duplex
repeaters with such rudimentary digital processing as digital AGC, digital
adaptive squelch, digital filtering, digital links and digital voters, digital
generation and detection of DTMF tones, and fully digital voice mail. Few
folks bother with simplex anymore for the very good reason that it limits the
number of stations that can be worked without access to good sites and high
power and because it *is* old hat. They want to try building *systems* that
have more power and flexibility than single user simplex offers. So if you
pass through and happen to work someone on one of these *systems*, be
impressed at the high level of experimental work going on.

And if you want to pass a few megabytes of data while you're here, try out
the GRAPES 56 kilobaud packet network.

And it should be noted that neither of the two systems described would have
been possible without the help of some dedicated and talented NON-amateurs.
Thankfully those people are now going to get licensed through the new tech

license and finally be able to *use* the systems they helped create. You see, they're some of the ones who find manual Morse Code impossible to learn.

Well Al, lots of my Vietnam era buddies ran ham patches with the duty radios on US ships. Course lots of those ships had guns on them. :-) I have a friend who is currently radio officer on a US flag ship and he says that getting permission to run ham radio is as simple as asking the captain's permission. At least in his case, the captain said, "Sure, as long as you don't interfere with the normal navs and comms." Since my friend is responsible for making sure the navs and comms work as his primary duty, this was not a problem.

Now to answer the original poster's question. Your best bet will be 20 or 15 meters with at least 100 watts output. It won't work every day, but should be usable quite often.

This is a wonderful question for discussion. Certainly one could make a great argument both ways. Here is my personal opinion:
DO NOT INTERFERE WITH ANY SIGNAL, LEGITIMATE OR OTHERWISE. The reason? Well, your signal may interfere with direction finding policing being done by someone else. I remember well how difficult it was to catch a local pirate a few years back because a couple of legitimate local hams thought the best strategy was to "jam" him on the air. Result: the legitimate "jammers" were making fools of themselves (again, my opinion), and it took much longer to try to catch the real pirate. We finally did catch him, after begging the locals to shut up. :-) Randy Padawer, WA4FJF

]Ham radio as a technical hobby do have a friend in Washington?

The ARRL represents its members. Since people who like to bash the ARRL for old fashioned views don't seem to interested in joining it and working from the inside, their views may be underrepresented.

The people on ARRL staff that I have worked with, and our Southwest Division Director (Fried Hein) certainly don't fit your description.

I get really tired of ARRL bashing. At least they actually do something to try to improve the hobby - within the limits set by their voting members.

This as compared to Wayne Green, et. al., who are constantly carping and harping and blowing their own horns.

Gee, some of the real anti-nocode folks warned that this was the ultimate hidden agenda, but I scarcely believed it. Since I got involved in ham radio, all aspects of the exams have gotten easier and easier. I suppose some folks wont be happy until there is no exam at all.

-- MAJOR SOLAR FLARE ALERT --

DECEMBER 22, 1990

Flare Event Summary
Potential Impact Forecast

MAJOR ENERGETIC EVENT SUMMARY

A major solar flare occurred at 22:46 UT on 22 December. The flare, rated a class M5.3/2B occurred from Region 6420 at a position of S25E63. This flare was not accompanied by any strong radio sweeps, but was associated with minor discrete radio emissions. The duration of the flare was 59 minutes. It began at 22:12 UT, peaked at 22:46 UT and ended at 23:11 UT.

Region 6420 is the second largest region on the sun at the present time. It is 1,380 million square kilometers in area and encompasses a total of 25 spots. The trailer spot complex of this region appears have some magnetic complexity associated with it, although this region is still classified as a magnetic Beta configuration.

Region 6412 (N17W68) is the largest region currently visible. This region has maintained a size of near 3,600 million square kilometers in area throughout its transit of the solar disk. It has increased in magnetic complexity from a Beta-type configuration to a Beta-Gamma configuration as of 22 December. It has not, however, spawned any significant solar flares.

Region 6415 has been very energetic this past week, producing numerous M-class flares. It was responsible for a class M4.3/1N flare at 23:21 UT on 22 December, which was associated with a Type II sweep. This region, however, is now rotating off the western limb and will not be visible on 23 December.

POTENTIAL TERRESTRIAL IMPACT FORECAST

Region 6420 may produce at least another major flare (and perhaps several more) as it transits the solar disk. Magnetic complexity in the trailer spot complex of this group will likely remain sufficient to spawn numerous M-class flares throughout the coming week. Expect numerous periods of radio distortion, SWF's and SID's on the sunlit hemisphere this week due to solar activity. As the active longitudes return between 26 and 28 December, expect M-class flaring to increase in frequency during the days with an accompanying increase in SID's and SWF's.

No significant terrestrial impacts are expected from today's major solar flare. However, if Region 6420 continues to produce significant flare activity, the risk for terrestrial impacts will become likely within the next two to three days, particularly after 27 December.

Regions 6412 and 6415 (this weeks major spot groups) will rotate beyond the western limb by 24 December. However, by 26-28 December some potential major activity centers (aside from Region 6420) may reappear on the eastern limb. Models currently suggest that the activity associated with these returning solar longitudes should remain generally intact, although the associated regions will obviously have evolved since their disappearance two weeks ago. Judging by recent trends, it appears as though some potentially major activity may be witnessed with the return of the active regions to the eastern limb between 26 and 28 December. More will be known as these regions begin to return.

I know the folks at UUNET must have been quaking in their boots worrying that once the FCC made their announcment, things on rec.ham-radio would calm down and they'd loose all that revenue shipping no-code flamage around the world. Well, I suppose they got a great Christmas present - as far as I can see, the traffic has gone UP!!! Well, maybe they should have guessed, but *I'm* surprised, naively so, I guess.

Well, maybe it's better than reading inane ideas for reorganizing the groups!!

(Pull the pin - roll it in the door, slam door closed, and run like hell down the hall!!)

>
> Consider a AM transmitter that has a Class D or E final and a switching mode modulator. About half the DC in comes out as energy in the sidebands. Now consider a SSB transmitter with a 50 percent efficent linear final. Half its DC in comes out as power in the 1 sideband. The received signal to noise ratio (neglecting QRM) will be the same for any given amount of DC power in. The AM system wins because the transmitter doesn't get hot and the receiver can be simpler. Fidelity is better, too. (This is all at the expense of twice the transmission bandwidth, of course.)

Conventional AM puts a minimum of 50% of the transmitted power in the nearly useless carrier and a maximum of 25% of the radiated power in a sideband with an equal amount in the redundant other sideband. During the frequent silent periods in speech the transmitter wastes 100% power in the unnecessary carrier. This is a very inefficient use of power even if the DC to RF conversion were 100% efficient. The IHF says that average speech only has a 12.5% duty cycle so an AM transmitter is automatically throwing away 87.5% of it's radiated power. Suppressed carrier modulation doesn't transmit any power during the silent periods. That's why the old Drake transmitters could claim 200 watts PEP with a pair of sweep tubes, each of which had 12.5 watts of plate dissipation.

The AM signal will suffer a 3 db penalty due to the wider receiver bandwidth allowing in twice as much noise energy. This doesn't even consider the fact that an AM envelope detector throws away another 3 db compared to the product detector used for SSB. However, if you use a coherent synchronous dectector and DSB suppressed carrier, you get a big win in signal to noise ratio. Noise is non-coherent and is strongly rejected by a coherent detector. As much as 12 db improvement over an equal power SSB signal is possible. About the only disadvantages of using DSB suppressed carrier with coherent detection are an increased susceptibility to selective fading and, of course, the consumption of twice the spectrum of SSB. With today's ICs it's relatively easy to build a top notch coherent DSB system.

You can:

A) ftp/mailserv it from SIMTEL20 (PD2:<MSDOS2.HAMRADIO>SM316.ZIP)

B) get it from the CompuServe HAMNET forum (the author hangs out there)

C) try either WB3FFV's or N8EMR's bbses (numbers in their signatures)

D) your on your own at this point.... :-)

Hope this helps.

Mark.

As quoted from <1703@ke4zv.UUCP> by gary@ke4zv.UUCP (Gary Coffman):
+---------------
| I have some ideas about what's wrong with the hobby other than presumed
| archaic licensing requirements, but let's wait and see before starting
| another crusade.
+---------------

I have some opinions as to why most people aren't interested in ham radio as well --- I wouldn't call it problems with our hobby, though.

The simple fact is that it's "in" to hold and defend uninformed opinions while belittling those who *are* informed. Anti-intellectualism is still alive and well in the U.S. And ham radio is a *technical* hobby, public service notwithstanding. After all, the basis of our public service ability is that we are supposed to know enough to know how to assemble and/or manage working communications setups. This *does* include integrating non-amateur services like cellular, Part 15 radios on 49 MHz, and even CB when they're appropriate... it's the *know-how* that is our most important asset, regardless of where or how we apply it. Know-how that ranges from pure technical to organization and integration of communications to produce effective and efficient communications. I still count the latter as technical, because you have to have at least *some* understanding of the possibilities before you can make rational decisions on how to integrate it into a working communications system. This is especially important in emergencies, when the local hams might be the *only* ones who know how to take a hodge-podge of radio equipment and devise a working emergency communications network out of it.

The simple solve-it-from-within solution is to drop the theory as well as the code. THIS IS THE WRONG SOLUTION! It destroys our most important asset.

The problem, and therefore the solution, are *outside* amateur radio. It's the same problem faced by the technical industries in the U.S. right now and looming large over their futures: the general public needs to be made aware of the importance of technical skills and knowledge, to the point where the general public will push for improvements in education and for more college students to major in technical areas.

This is the *biggest* threat to amateur radio. Not code/nocode, not a sudden inrush of unruly "CBers", not the encroachment of commercial services on our bands. HAM RADIO IS UNPOPULAR BECAUSE UNDERSTANDING TECHNOLOGY IS UNPOPULAR. After all, how much do you need to know to operate a cellular phone or a Nintendo?

If there is one area that I would recommend be addressed by all radio amateurs as quickly as possible, it is this one. Because it's not just ham radio that will go down the tubes if we don't....

++Brandon

                          ^
                        lose
```

This is a minor nit to pick, and in no way as important as code vs. nocode wars... In the last year, I have noticed that there are gobs of people on usenet that don't know the difference between "loose" and "lose". For the last time:

```
     loose - (loos) as in not tight.
     lose  - (looz) as in can't find anymore, or lost.
```

That done, please disregard, and return to the inane code vs nocode wars.

It would also make it easier for the mindless anti-no-code bigots. I think no
callsign distinction is the better approach. This way people will get to know
and like one another before an Old Fart finds out, "Oh, no, he's one of
THEM!"

One thing about this bemuses me. Why do the OF's assume that THEM have any
interest in talking to Buffalo Bill Code-y? We may very well have a situation
now like in Jean Auel's "Clan of the Cave Bear", in which the "Others" are
replacing the "Flatheads" as the dominant anthropoid species.

No it isn't! Not unless you have no inhibition about relieving yourself into the lavatory!

Ask directions for "la toilette" or even "le W.C." (this latter Anglicism has crossed the Channel and is apparently widely recognized in France).

And be careful in taking a French hotel room. If you get "une chambre avec salle de bain," you get a room with a bath--but not a toilet. Look for "une chambre avec salle de bain et toilette" if you don't want to share a W.C. with strangers.

France is a *beautiful* country; be certain to get *away* from Paris to get to know the charms of its villages and farms. I found France to be a wonderful mixture of the modern and the ancient, and the only rude French I encountered were Parisians (or is it "Parisites?" :-) :-) :-))

> I'm not saying the name is broken here...
> It's just not as descriptive as it should be.

Look up the words. Ham is better than amateur at describing the hobby.

> As part of the structure enhancement rec.radio.amateur.satellite might do
> some good towards the end of distributing some of the traffic.

But there has been NO suggestion of r.r.a.s. You are right --
changing the structure will distribute the traffic. The ONLY structure
change is adding the .legal subgroup, which is NOT dependent on changing
anything else. Adding r.h.l will have the same effect as changing the
name and adding r.r.a.l, with less work for all.

> >   There is still no evidence that renaming the group will make it better.
>
> There is no evidence it WON'T make it better either.

If there is no evidence either way, why bother to do it at all?

P.S. Alan - your system is mis-configured. It is delivering mail to the
wrong places and abusing net resources. Fortunately, I was able to stop
mine from automatically correcting your error and resending it. You
should fix yours, I might not catch it next time.

Slight correction on terminology....There is certainly some "CW-Only"
portions of amateur spectrum as set up by US regs, but there is no
such thing as "Phone-Only", i.e. I can use CW anywhere in the amateur
spectrum. There is only custom saying I won't do that.

I heard that RF Parts sells some VHF RF amplifier modules. Apparently
all you need is a heat sink, DC supply, and a transmit receive switch.

Jeff

> I'd better write to the FCC and see if amateur radio still
> exists or not. :-(

It does not. Not in any sense of the original meaning. Perhaps there
are a few actual hams left, but their number is so small as to be in
the noise. What we have today is something approaching what was called
'CB' circa 1970. 'CB' has deteriorated since then. So has amateur radio.

That was bottled up. What you saw was just what leaked out!

This is getting ridiculous. The deed is done, and regardless how people feel, they'd better make it positive.

Just the other night on a local repeater this was discussed, and this one ....INDIVIDUAL.......... (I'm bottled up again!!) started talking about no-code in HF ruining the hobby and about international treaty.
I TRIED to be polite, but after about 4 exchanges he INSISTED about moaning about how it was protected by treaty. I signed. You gotta remember about arguing with a rock. Teaching a pig to sing just annoys a pig, and he still won't sing. The rock won't even get annoyed.

But what got me was the attitude that HF was 'protected' and his attitude
of CW is HAM radio.

Unfortunately this will drive the CBers up to 28.000 and above destroying the CW portion of the band. They are already transmitting there now and making portions of the CW band unusable.

My impression is that it is very difficult to get permission to operate an Amateur Radio station from a commercial vessel. You can't just use the ship's radio on the ham bands, because by law (at least for US-flag vessels) the Amateur and Commercial apparatus must be completely separate.

You can always send a message by commercial ship-to-shore radio. Don't know what it costs. If it's a small ship it likely will be sent by M**** c***. :-)

I wouldn't add trickle charging to my HT.
The ability to run the HT directly on DC without charging the battery is one
of the big reasons why I chose the TH-75A over other models!

When you say that "NiCd cells don't have a memory problem" do you mean that it
is not damaging to discharge them somewhat and then recharge them?
(recharging them when they have not been discharged to their rated discharged
voltage, but not OVERcharging them)
Also, is it really that damaging to leave NiCds on TRICKLE charge, let's say
6 ma for a 600 ma/H battery?

Hi. A quick question about Chebychev low pass filters. The ARRL Handbook says that the passband SWR depends on the passband ripple (bigger ripple, bigger SWR). My intuition tells me that that would only become a problem if you actually used the filter all over the passband; SOMEWHERE in the passband the high SWR would occur. If I'm running at a single, crystal defined frequency, can't I tune my antenna for good SWR regardless of my filter?

Also, a more theoretical question on filters. A low pass filter prevents high frequency energy from reaching the load. However, the filter is comprised only of inductors and capacitors, so it can't dissipate that energy. Furthermore, the filter components can't store it either, since that would result in a long term uptrend in stored energy which would violate the assumption that everything is steady state. The only place left for the energy to go is back to the source. So apparently a filter really functions as a reflector in its stopband, sending energy back to the source rather than allowing it to reach the load.

Of course, this means that the source must absorb all of the stopband energy. I'm building a QRP transmitter that filters a square wave to get a suitably pure sine wave. That's no problem. But if I add a power amp stage to get more power later, I think this means I should amplify the sine wave rather than the square wave. Because if I amplify the square wave and then filter it, the amplifier output stage will have to absorb the now amplified harmonic energy. Right?

Any feedback will be appreciated!

Thanks,
Kip Ingram

Sorry, but I don't understand your point. Are you suggesting that we should
continue to require this code speed in amateur radio so Navy recruiters
will have an easier job? If THEY need 17-25 wpm, let them provide the
training; we are not their farm team.

> have done to P.O. these people so much? I didn't hear anything bad. ...

I didn't see any replies to this, but I, too, would like to know. I listened to 14.313 last night for the first time and, although there was a lot of lecturing on foreign affairs, I didn't hear any real objectionable material or operating practices. What's going on here?

In perusing my copy of Part 97, I find paragraph 97.119(e), which says, in part, that operators who are using privileges based on a CSCE must add an indicator of this following the call sign. The Technician indicator is KT.

I used to hear this all the time. "KA1XYZ interim KT." "N0ABC temporary AG."

Has this part been rescinded, or is it just being ignored?

X-Reader: NETNEWS/PC Version 2.1

Hi
I'm making a metal detector for my son's birthday - you know the sort of thing that it's obvious how it works and you just whip one up in an evening :-) Well I did that and I have a few questions ...

I'm using the two oscillators at about 300KHz mixed together and listening for the beat note. One of the oscillators is fixed and the other has the search coil as its inductance, so that its frequency will vary when metal is bought close to it.

I've prototyped it last night and it seems to work but it's not as sensitive as I'd like. When the oscillators are about zero beat (or close) you can detect (" denote INCHES):

(The round coil has about the same inductance as the oblong one - I didn't count its turns)

	COIL Shape and Turns	
OBJECT	15Turns 4" x 6"	4"diameter
3"*3" PC bare PC board	5"	4"
Bean Tin 5" diameter	7"	5"
Coin 1.5" diameter	2"	1"

The coil shape obviously has a marked difference on the sensitivity - what is the optimal shape and screening (ie should the coil be round, square, oblong, a spiral to encompass a lot of area, shielded)?

I'm aiming to be able to detect objects at greater distances that the above. Obviously the type of metal has an effect but there must be some general guidelines. Do you need different shaped coils for maximum sensitivity with different sized object? One magazine article suggested that the sensitivity was related to the ratio of the object size to the coil size, but didn't give any further guidelines :-(

The frequency I'm using is sort of mid-range, I didn't want to go too high in case the metals are too lossy - I know this sounds sort of vague, but I know for example that you don't use a nail as core for RF coils :-) Would a higher frequency be better?

The other sort of metal detector I know of has two coils are right angles to minimize the coupling between them, until some metal comes along. Is this type notably more sensitive?

A friend has just come in and suggested using a phase comparator as in 4046 VCO chip instead of listening to the beat note - Seems as though this might be too sensitive ???

Gian, my son is only seven and would be happy with the current version, but _I_ don't like not understanding the things I build :-)

Any suggestions would be welcome.

Thanks
Giovanni ZL2BOI

Sorry, but I and the local VEC disagree with you on this. The 55 questions represent a two-part exam comprised of the existing Novice exam (30 questions) and the exisiting Tech exam (25 questions). If you have credit already for element 2 (the Novice written) you only have to take the Tech written.

The exam structure has not changed. Its just that elements 2 and 3 will get you a Tech license in mid-February.

No. They should remove all voice privileges from 20 meters and make it a digital only band (for the U.S.) like 30 meters.

That would solve lots of problems.

Every Saturday afternoon National Public Radio brings you
Car Talk starring the click and clack brothers Maliacci (sp?).
Each week they give a stumper question the answer to be
reveiled the following week. Most of the questions are about
cars but last weeks went somthing like:

A woman brings in something electrical to a repair shop.
The repairman says: I haven't seen one of these for awhile.
they used to be illegal.

A group of us brainstormed that one for awhile but didn't get
close to the answer, even though one of us is a SWL.

The 1990 Passport to world band radio has an article concerning
forbidden listening in various countries. It says that during
WWII German and Italian nationals (not citizens) in the US
possessing SW radios were required to surrender or render the
SW bands inoperative.

But did this apply to US citizenry at large?

My primary station callsign is WB6CYT; it's a Technician operator class and has been since I first became a ham 20 years ago.

Yes, I believe in a classless amateur radio service.

I've sent you a copy of my filing with the FCC under a separate cover; those paying attention have seen it posted here before so I won't inflict it on them again. Briefly, it maintains that there should only be two classes of license - one with code to satisfy international requirements for operation below 30 MHz, and the other without code. Both would have a simple exam sufficient for the applicant to prove that he knows enough to operate a ham station without causing interference to others hams and services - NOTHING MORE IS NEEDED. I propose that the ARRL issue technical certificates of achievement (just as they do now for code proficiency) to appease those who need paper to document their achievements.

As you requested, a copy of the appropriate Usenet RFCs are also on the way to you; you'll find in there the requirement to include a subject in the posting of a message, which your broken news software isn't doing.

I must disagree. IMHO, much of the opposition is due to the "because I went through this shit, you must go through this shit" syndrome. This phenomena is most clearly observed in the treatment of medical interns/ residents but can be discerned here also.

To put in my $0.02, I am not in favor of dropping or lowering code requirements. The only reason why I got my Tech license was because of the challenge of learning code. IMHO, the fun would be lost in upgrading if the code requirements were eliminated. Most of the sense of accomplishment is from the code. The theory is bullshit. How could it be otherwise when the FCC gives us both the questions and the answers?

Of course, this is only in my case. Others may (and probably don't) find satisfaction in the challenges of learning code. Oh well. Hopefully, I will have the time to work on my code speed and take the General exams.

If I remember correctly, he had lost his patent battle with none other
than the mega-conglomorate RCA (with whom I was employed when I read
Armstrong's biography). His widow won back those rights in the '60s
(if I remember --- can someone with the book handy correct me?).

At the time, the late great RCA had a team of stratospherically priced
lawyers who were very good at proving RCA engineers had invented everything
RCA felt it wanted. Armstrong was one of many victims.

However, on the positive (or humourous) side -- I remember having a
conversation with one of RCA's chief scientists before the demise of the
company at the hands of neutron Jack. Our conversation took place in
1981 if my memory serves me. The scientist said that RCA had just discovered
in its archives that it had "the" patent on video text. That is, any textual
display on a cathode-ray tube. It seems it was invented by an RCA radar
engineer during WWII to help mark data on a radar screen. RCA had never

sought to enforce the patent, and even though it had been renewed through the standard procedures the statute of limitations on that sort ofthing had run out. RCA had 3 months with which to bring its case against all manufactures of computer peripheral and display equipment to try to collect. He had been brought in as the "technical expert" to testify.

Naturally, RCA didn't stand a chance. However, some of the companies threatned by RCA's suit decided to settle anyway..to the tune of several hundred million American Samoleans.

Then, of course, GE came in and tore RCA to shreads in good old American Entrepeneurial style and left only scorched earth. So, much for good old General Sarnoff and a lot of people involved in the beginning of radio.

It was kind of a neat place to work, for a while.

Joe

No puzzle! The General Radiotelephone license requires a heckuva lot more technical knowledge than the General class Ham license, but no CW or operating practices knowledge. But then it doesn't convey the Amateur privileges. Always wondered why it was that the G.R.T. holder can work on all sorts of transmitting equipment, yet couldn't even use Novice privileges. Certified technical prowess apparently isn't the only requirement for being a Ham.

My comment was in direct response to the statement that "there is no national need for fast CW operators." The Navy officially disagrees...else they wouldn't offer comparatively high-grade enlistments to CW operators.

Further, I'll point out that ham radio has historically been the military's farm team. Why do you think they're so high on ham radio? It's not just because of the frequencies we could make available to them...

In <mcovingt@athena.cs.uga.edu (Michael A. Covington)> Michael says:

(Re: Re: A New Problem)

>The first wave of new Techs will be families of hams, and people who have been on the periphery of ham radio for some time (e.g., serious SWLs), and I expect these people to be very well behaved and to respect what's valuable in the traditions of ham radio.
>
>The next wave will be serious electronics enthusiasts and the like.
>
>I think that CBification will not happen, because people who just want to talk on the air will be rather put off by the theory exam. You have to remember that to someone with no electronics background, the Technician theory exam is not trivial.
>

While the material itself is not trivial, the exams are. There is living proof right here on this net that you can get a tech and above without any real technical knowledge. All you need is the ability to memorize. Check it out. Round up 25 ticket-holders and give 'em a no-notice exam for their class of license. See how many pass.

>And most of all, the process of studying for the theory exam will create a sense of commitment the same way that learning the code does.

I'm still skeptical. Suppose there is a big hue and cry to eliminate the theory exams? (to get more people into Amateur Radio, of course) CB-ification will have been achieved. Can't happen, you say? Well, they said a No-Code Ham license would never happen several years ago. Never say Never.

The proposal looks pretty good overall. It definitely makes sense to unify
things under a `rec.radio' category.

I don't know about replacing `ham' with `amateur'. I think most people would
call themselves `hams' and not `amateurs'. Besides, `ham' is easier to type.
Basically, it doesn't seem to me like there's a good enough reason to change
it from what it was. But i don't think it makes a big difference either way.

I think that it'd be useful to have a separate `tech' group. Questions like
``What sort of cut-off slope can i get with so-and-so filter?'' don't really
belong in a general group. Regarding flames, the `legal' group is supposed to
take care of that, so i don't see why that should stop us from creating
another group. And regarding gatewaying, i don't see why both groups couldn't
be gatewayed together. The mailing list members need never know there are two
separate groups.

Finally, i'd recommend that the left-over group be specifically called `misc'.
I think this encourages people to classify their discussion into the right
group, rather than just dumping it all in a parent group. There's already at
least three subgroups, and most likely more will be added in the future. So
we might as well do it right to start.

Therefore my proposal is the following:

rec.radio.ham.legal
rec.radio.ham.misc   (from rec.ham-radio)
rec.radio.ham.packet (from rec.ham-radio.packet)
rec.radio.ham.swap   (from rec.ham-radio.swap)
rec.radio.ham.tech

TH-27A AM mode info, obtained from N5OFF, who got it from Kenwood:

When the TH-27a is placed in the AM mode, the microprocessor sends control information to IC1 on the RF board. The microprocessor also turns on Q210 on the IF board. IC1 tunes the receiver front end band pass filter circuits and turns on Q4. Q4 passes the 5 volts supplied from Q210 to the AM circuit on the IF board.

The AM circuit board (x58-3750-00) contains IC51, Q51, Q52, and Q53. The AM detector, IC51, receives the khz IF signal from the IF filter CF201. The AM detector passes the recovered audio to amplifier Q53. This transistor passes the amplified audio to the transceiver's squelch and audio circuits. Amplifier Q51 provides agc to IF amplifier Q41. Transistor Q52 is used to turn off the FM detector circuits when the transceiver is in the AM mode.

The radio is placed in the AM mode by holding the f key for 1 second, and then pressing the mhz key. The AM range is restricted to 118-135.995 mhz, retaining step and squelch functions.
The AM actually sounds quite good for such a small speaker, and sensitivity appears to be as good as an airband scanner on a comparable antenna.

>code." Those people will rush to get no-code licenses. That's what frightens
>me about no-code, and _nobody_ has yet shown me that that fear is unfounded.

I hear what you are saying ... that all those screwball CBers will jump up to 2 meters now that we have no-code. You may be right, but I disagree. The same argument was made against the ARRL's pre-WARC-79 recruitment effort, which concentrated on CBers because of the 70's CB craze. Ham radio did not shrivel and die, and very rarely was the word "breaker" heard on any band but 11 meters.

I just don't think the mentality of some of those folks is right for ham radio, so they won't be interested. They're happy where they are. They don't need or want a stricter environment. Can you imagine a conversation like this on CB:

HIGH STEPPER: (whistle into the mike) Ahhhhhhhdeeeeeooooohhhhh ah break breaker, breaker, breaker, good buddy, this be the one duck-pluckin' high-stepper, wall to wall and treetop tall. Rubber duck, ya got yer ears on?

RUBBER DUCK: Dat be fo' duck-puckin' sho', high-stepper. Ya hear dat ders a new license for ham radio where ya don't need to know dat morse code stuff?

H.S.: Dat's a big 10-4, good buddy. Say, lez say we go down to da Ham Radio Outlet and buy us an Icom, so's we can work dat 2 meter band. I'll bet we'd be able to find more Smokeys with dat 2 meters. And we probably be able to talk more skip too.

R.D.: Dat be for duck-pluckin' sho! Will my black box (linear amp) work on dat 2 meters?

Something tells me that such conversations are NOT gracing the CB band today.

My wife (yes, she does crossword puzzles with a pen), upon hearing about the no-code Tech license, said "But I don't want to talk on the radio, I just want to learn Morse Code !". After achieving Tetris level 9 height 4, she's looking for a new game. I gave her the "Tune in the World" tapes. I'm curious to see how far she goes.

The other funny part is that she feels less confident about learning the technical stuff (which was trivial for me). It takes all kinds, I guess.

>the restrictions are there through the whims of the FCC.

Correct. Take Canada for example.  You sometimes hear Canadians
on "CW-only" frequencies in the U.S.

As quoted from <18323@shlump.nac.dec.com> by magid@esis.enet.dec.com (Joel Magid...):

```
+---------------
|    1. Wouldn't it have been nice to see the FCC change the requirements
|       for elements 1B and 1C to something like the following:
|
|         1A code @ 5WPM
|         1B computer operations (basic understanding)
|         1C computer    "       and theory (advanced)
+---------------
```

Too much emphasis on computers. I wouldn't mind seeing:

```
     1A   5wpm code
     1B   digital modes (RTTY, AMTOR, packet, etc.) and computers
     1C   Video/facsimile (fax, SSTV, ATV...)
```

HOWEVER: if we do this, I would change these to endorsements. It doesn't make sense to consider 1A (or, for that matter, 1B) a prerequisite for 1C.

I don't expect to see this any time soon; the FCC would have a screaming $#!+ fit over the paperwork. But it seems more rational than the current system --- and it can be combined with an incentive licensing system if desired. One that actually *provides* an incentive, by strong preference....

I built the same project, and it works pretty well. 120 miles on an HT
is so gratifying :-)

If you want 440, maybe just drill holes in the boom for the directors
and reflectors and use bronze brazing rod. You could use a scavenged TV
element for the split-DE w/ hairpin. There are element scaling
equations in the ARRL Antenna book. The Antenna book also has equations
for optimal long-boom yagis, which would make sense for the 440 yagi on
a 6' boom.

I agree. I think that...

(1) There is no longer a national need for fast CW operators. A 5 wpm
code exam is enough to make a ham "code-literate." After that, we
improve our speed if and when we need to for on-the-air usage.

(2) There *is* a national need for people who understand computer
communications -- *and* a need to attract computer enthusiasts into
ham radio.

THEREFORE, I think hams ought to be able to offer exams on computer
communications in lieu of the 13 and 20 wpm code exams!

I'm glad they didn't. Too many antiquarians are threatening to ostracize
the new hams.

Anyhow, distinctive call signs don't give you any information now.
KC4BDT is Extra Class; I (N4TMI) am Advanced; etc. Lots of hams keep a
lower-level call sign when upgrading.

> >It is not illegal to BUILD equipment.
> For just about any other service, yes it is.

There are no quotes below that prohibit BUILDing equipment, in the context of this discussion.

> >It is not illegal to OWN a receiver.
> For cellular phone without a service contract? Yes it is!

It is not legal to manufacture a receiver whose primary function is the reception of cellular telephone. It is NOT illegal to OWN a receiver which has the capability to receive cellular phone. If you truly believe it IS illegal, you must immediately destroy your old television sets -- those with channel 83 -- or be in violation of the law.

It is not illegal to OWN a cellular phone without a service contract. In fact, in CA and a few other states, Radio Shack is PROHIBITED from selling cellular phones any other way. They MAY NOT force you to sign a service agreement as a condition of sale. In this area, CA is progressive.

> For 10.525/24 GHz in Ct, Va, and Dc, yes it is!

It is not illegal to OWN a 10.525 GHz receiver, in any state. It IS illegal to USE said receiver in your automobile. Possession of said receiver in a location where it may be used in a vehicle is assumption of use. Possession in the trunk is not. It is not illegal to OWN an open bottle of liquor, except for minors. It IS illegal to USE that open bottle in your automobile. It is not illegal in your trunk.

> Regarding the CB service and modifying radios:
>
> Title 47, Part 95
>
> 95.425 (CB Rule 25) May I make any changes to my CB station transmitter?
>

Any radio not the CB station transmitter is not covered under this rule. If the radio in question is not type-certified it cannot be the station transmitter. Any equipment built or modified, unless recertified, is no longer capable of being the CB station transmitter, and its USE as such is prohibited.

> 95.424 (CB rule 24) How do I have my CB station transmitter serviced?

Ditto above.

>
> For the Private land mobile radio services:
>
> 90.427 Precautions against unauthorized operation.
>
> (b) ... no person shall program into a transmitter frequencies for which the licensee using the transmitter is not authorized.

This rule does not prohibit the ownership, modification, or building of equipment. It prohibits USE, by a licensee, of unauthorized frequencies. If you are not a licensee, you are not covered.

If you read this rule out of context, it also seems to allow the USE of modified or built equipment, as long as you are authorized to use the frequency. This is certainly not true, as is stated in the original post, and is why taking rules out of context is very dangerous.

> For the Aviation services:
>
> 87.73 Transmitter adjustments and tests.
> A general radiotelephone operator must directly supervise and be responsible for all transmitter adjustments or tests during installation, servicing, or maintenance of a radio station. A general radiotelephone operator must be responsible for the proper functioning of th station equipment.

An aviation station is a very specific thing. Any equipment not part of the station is not covered by this rule. No aviation station licensee is prohibited by this rule from owning, modifying, or building any equipment he desires. If I owned an airplane (which requires a station license) I may legally add an amateur transmitter (which may be built or modified by myself) without the supervision of the general licensee, as that radio is not covered under the aviation rules (except for the mechanical considerations of weight and airframe modifications).

> I have read parts 0-19 and 80-97 exhaustively. I don't claim to remember everything I've read, but I sure remember that your above generalizations are not always true.

If you read the generalizations, as written, including the emphasized words, they are true.

If you include the entire context of the previous post, which clearly said that usage of the modified equipment was not legal, the generalizations are true.

If you include the context of the regulations you posted, the generalizations are true.

> Please read the
> regs for other services before you arrogantly generalize and patronize other

> readers of rec.ham-radio.

Please accept the difference between OWN, MODIFY, BUILD, and USE.

Just as you would upgrade to the current Tech privileges -- take the test.

> It is my understanding that the new 55 question pool will include questions
> from both current novice and tech question pools. Will he/she be
> required to take the new 55 question test which will include novice
> questions? I think that would make about 75 questions total ...

The test will have 55 questions. To upgrade, you would take a test of 55 questions. To walk in cold (no license), you would take a test of 55 questions. If you walk in and take the Novice test and decide that it was horribly easy, and then take the Tech test, you will take the Novice test, and then the full 55 question Tech test. You do not need to take the Novice written test to be a Tech. You do not need to take the Tech test to be a General. You need only 55 questions.

If you want the current Tech <30MHz privileges, you will need to take a 5 wpm code test.

> 2. Does anyone have a phone number to the FCC for general info regarding
>   Amateur radio?

Not off hand. Isn't it in the rulebook you keep by your rig?

Why not just get on the air, use a fake call, give out your name and address, and interfere with as many commercial broadcasters as you can.

They will call you. ;-)

I was under the impression that there were many Amateurs with impeccable
operating practice who never use CW.
Are you sure that it is "CW "operating" [that] has made sure that new
Amateurs learned good operating practices"?
And, is it really that hard to have poor CW operating habits? It seems to me
that you could operate CW on top of someone elses voice signal. All you have
to do is turn on that narrow CW filter and BANG! you can ignore everyone else!
Operating CW doesn't require good operating practice; it certainly doesn't
teach it.

You don't learn to be a good operator by using a specific mode.
You become a good operator by LISTENING to other good operators,
 not by TRANSMITTING, be it in CW, AMTOR, SSB, or PACKET.

If you find it difficult to have good operating practice in any mode other than
CW, by all means, operate CW!
There are many other Amateurs who operate properly whatever the mode.

Maybe it isn't the mode or the code?!?

I have been reading the details about the no-code ticket and I was tempted to try for that ticket. Yet, I want to learn the code as well. Tonight I spoke to one of toledo's well known hams and he that years ago, when he had his Commodore 64 computer, there were programs that helped people learn code. I have a commodore 128 and I would like anyone who has any programs of this nature. If they are on any annonymous ftp sites, I'd like to know and if anyone can send them over the net. I am eager to learn my code and I programs of such nature can help me earn my ticket by allowing me to practice code.

Thanks in advance,

Tony

My question is: how many people will rush to get the new no-code ticket?
I think that most new no-code hams will fall into the following categories:

1. Friends / spouses of current hams

2. A few CBers who may have been intimidated by morse code

How many more people will this be? Not too many, I fear.

However, we in the amateur community have a great opportunity to enhance growth in our hobby if we actively promote the new no-code license. If the new ticket is actively publicized, we could see new hams from other categories:

1. Elderly / shut-ins

2. Kids

3. People in the general public who may never have heard of ham radio

4. Serious CBers who have heard little or nothing about ham radio

I say ... let's DO IT! Let's pubicize the heck out of this new ticket. A lot of people out there could experience the same fun that we have in ham radio. Any hobby is better when more people are involved in it!

It didn't sound tongue-in-cheek to me!!!! Especially if the ACLU gets their way, and they make certain scanners illegal! Then it WILL be illegal to own a receiver.

Gosh, I really hate it when legitimate questions are ridiculed like this.

So CW *won't* get through better than other modulation methods after all.
Sorry to be snide, but I couldn't resist after all the pro-code claims.
Pirates are everybody's business and should be fought as strongly as possible.
Right now the FCC is still hacked about being taken to court by the ARRL
and seems unlikely to take action. If these turkeys can be located, perhaps
a hundred thousand letters sent directly to them complaining about their
illegal actions might help. You can count on me to write a nasty letter.

>A message to all who want to be able to enjoy the hobby in the future:

>ONLY.

Too bad you have to die. 30 meters is not now, nor has it ever been CW only.
Listen to the packet and RTTY signals on the band sometime. Not all no-coders
operate voice only you know.

By all means, use CW if you want.
But how often is "voice communications impossible"?
Assuming that a phone call is out of the question,
in most cases, other Amateur modes will also "get through."

But telephone can't deal with many people at once without a party line.
And, besides, Amateur radio is much more fun AND works when the phone
lines go down.
If you want to talk to hams, what better place then on the radio?
I have only seen a few instances of jamming:
 on CB
 on repeaters
 on the HF general portions.

When two individuals are talking without the aid of a repeater, it is
difficult to jam them since they can always switch to another frequency.
(Yes; they may have to have a backup frequency)!

Why should it frighten you? I've listened to those guys too, and to
tell you the truth, I would have a hard time telling them apart from
"real" hams. The lingo is the same, the conversation topics are the
same, the equipment is even the same. :-)

About the only thing that gives them away is a) the inability to
standardize on either USB or LSB, and b) the absence of callsigns.

Your ears must be better than Gary's.
If he couldn't reliably tell by ear that a signal was present then I very much
doubt that he would have been able to copy the CW.

Mike, you've got to learn to quit bottling up your feelings. [:-)

Truth be known, however, I'm also disturbed by the CW diehards who WANT the
new no-code Tech license to fail and/or produce the end of civlization as we
know it just so they can say, "See, I told you not having your ears attacked
by a whistling woodpecker would be bad!"

Here are some reasons why I'm glad that the FCC isn't making a new set of
distinct call signs for the no code techs:

-there are enough classes of call signs already.
-he wouldn't have to give up his old call when he passed the code.
-anti no-coders might be rude, refuse to communicate with them, or even jam
 them.
-he's got full technician priviledges above HF, so what's wrong with his
 technician call?

Don't separate them from the experienced hams; bring them in, teach them
 what it is to be a good ham; let them teach you what they have to bring
 to this fine hobby-service.
Somehow I think that many of our parents and spouses are going to become
licensed, now. I also think that they will do so in order to communicate with
us. If we practice the good operating that we preach, they will be the
very best of hams since we will be their elmers.
With these people, we can afford to fill the ranks of Amateur Radio.
We may not win back all of 220, but it sure is going to boost Amateur Radio's
support in the government and in the eyes of the general public.
It will also boost our ability to respond in an emergency, since there will
be more Hams available to turn out.

If you are worried about Amateur Radio becoming another CB band, why not
become an Official Observer? These are the people, as well as every Amateur
who operates according to the code of Amateur etiquette, are the ones who
prevent Amateur Radio from becoming like CB.
If CB were administered like Amateur Radio, instead of like a free-for-all,
maybe it would still be a pleasant place to chat.
If we work together to train the newcomers and curb those established bad
apples, Amateur Radio will always be a pleasure to use.

Where did you get this one? The information I was given indicated
that all the FCC did in their meeting of 13Dec90 was drop the requirement
of element 1a for Technicians, meaning that the Tech 'test' would be
Element 2(the Novice element) and Element 3a(the Tech element), sorta the
first amateur exam to have two theory test, if you went in 'cold'. If you
went in with a novice, or had just passed the Novice (credit for 1a and 2)
that all you would do for Tech is take 3a...the same exam upgrade path
as always. But then again...misinformation is the word of the week.

Advice received today from our VEC: the new codeless tech test is the current
element 2 (Novice) + element 3A (Tech.) Nothing different. Let's hope they

sound a little better than the cb'ers investing 10 USB these days.   QSL QSL QSL QSL and isn't that a big roger.

Ah, you haven't used AMTOR then. I have dredged intelligence out of the noise with AMTOR that I could not do with any other mode. I'm not knocking CW....I like it a lot. But AMTOR is VERY robust on HF. Once the ARQ link is established, if it can copy just an ocasional chirp, the message will get through with no errors.

On CW or phone, the sending station keeps sending, even though you may copy only 10% of the intelligence error free. ARQ AMTOR requests repeats when it gets a bad chirp. Of course packet does this, but not too well on HF in its present form.

Their wierd thing with AMTOR is that when the path is deteriorating, I can still copy flawlessly (although slowly) when there seems to be little if any audible signal there.

WHAT VHF experimenters? Most of what I hear on VHF is folks yakking on
repeaters. I hardly even hear FM simplex anymore.

Oh, excuse me....thats right....none of the new folks with the new tech
license will be yakking on 2 mtr repeaters. They will all be showing
us how antiquated our other modes are if we aren't using DSP....

>use them to guage the speed of their pitchers' fastball.

If you are not a ham, you must license the transmitter in the fixed
radiolocation service. This requires filing an application with the
FCC AND having your choice of frequency coordinated (expensive). I
recently contacted the local FCC field office and requested
all forms that would be necesary to license a radar gun. I received
a form that contained about 10 pages of fill-in-the-blank (forget the
form number) plus a thick guidebook for filling out the form (!) plus
a list of frequency coordinators.

Normally this licenseing is handled by the radar gun vendor as part of
the gun sale. You as a citizen don't really want to go through the
hassles. Just tune the gun to the ham segment of 10 ghz (or pretend
you have) or just operate the K-band unit under your license since
we share that band. Be sure and check the rules regarding operating
beacons and rangefinding equipment. I believe you used to have to
afix a printed callsign to the transmitter in lieu of other ID methods.
BS true, but vital if you get hassled for "shooting" the local fuzz.

(BTW, you outta see a duty chief sputter when you walk in to a police
station and ask to file a speeding charge against a cop and present
radar evidence to back it up. :-) What's good for the goose.....

John

This is *NOT TRUE*!
Most of the World has *NO* 'CW Only', 'Phone-only' sub-bands. It is only
a result of the FCC licensing policy that the USA has these restrictions.
There is *NOTHING* in ITU regs. to give foundation to the US restrictions;
the restrictions are there through the whims of the FCC.

In most of 'the rest of the world', bandplans are by voluntary agreement.

Our club in Texas a few years back built our entire 220 repeater from kit boards from HAMTronics. It worked OK, but after a lightning strike, we obtained a Midland, and split it in two for the repeater. All the interface and control was custom built and Z80 based.

Tell that to KA5ZCK, who's sometimes addressed as Lieutenant Robert M.
Craig, USNR-R. He's told me a couple of times that he's always looking
for people to copy code, and was prepared to offer E-6 or E-7 enlistments
(I think...don't hold me to that, but it was in that range) to people who
could come in with demonstrated code proficiency in the 17-25 WPM range.

Ok; I've got to get my two cent's worth in on this issue. One of the stated purposes of the Amateur Radio Service (and the one that seems to make the most sense from in the "big" picture) is to maintain a pool of individuals skilled in communications technology. In years gone by, if we found ourselves in a war, the military needed good CW operators and needed them FAST. Hence the CW requirement for ham licenses; it was completely correct and totally proper BECAUSE IT SERVED THE NATIONAL INTEREST. Hams offered this resource to the nation, and in return got to use valuable spectrum space.

So the CW question is easy to dispense with. Does a significant amount of military communication still use CW? Could a crisis arise today that would be more severe if no CW operators existed? If it could, if we still need CW operators, then the license structure should encourage CW training.

On the other hand, there are new technologies (satellite, packet, computer communications, spread spectrum, and so on) that I know for a fact are very important to the military these days. Therefore, the license structure should encourage skill in these areas.

I happen to think that the new codeless license gives too much for too little. The new Tech test, which is a combination of the old Novice and Tech tests, is a joke at best (I know; I just took the Novice and Tech). I have no objection to an "easy" entry into the hobby, but the privs you get for taking that route should be quite limited. New privs should be earned by becoming more competent in some branch of communications technology.

Sorry about rambling. To sum up, the procedure for developing a license structure should be the following:

1. Identify the nation's communications personell needs

2. Develop an entry-level exam that gives the licensee a basic overview of each of these crucial communications areas. This exam should be quite easy and would serve mainly to make hams aware of the broad field and ensure that they were cognizant of the rules and regs applying to them and of the penalties for failure to comply.

3. Provide a multi-ladder advancement program, whereby hams can gain more privs by training themselves in one of the specific areas identified in step 1. Each successive step should require more and more expertise in the area. Reaching the top of a ladder should indicate a profound technical knowledge of the area involved.

It is important to note that achieving high levels on one "ladder" should not entitle a ham to high privs in another area. He should have to go back and learn the new area from the bottom up. In this manner there will be an incentive for hams to become highly expert in many areas of communication theory. The privs associated with a particular area should be comensurate with the value the FCC attaches to that particular area of technology. For instance, if the government still needs CW, but not much, the CW ladder might lead to relatively modest privs. On the other hand, the reward for mastering an area that is extremely valuable would be very great (lots of spectrum space, high power privs, etc). Whatever works. Also, there is no reason that the value of various areas should remain static. From time to time the FCC should review the privs awarded for various skills and make suitable modifications. In this manner they will continually guide hams into the most important areas of technology.

In short, ham radio is a program for building the nation's technical resource base, not a freebie rag-chewing program. Let's keep things in perspective.

BTW, I zipped up the asbestos suit BEFORE I EVEN STARTED THIS MESSAGE, because I'm sure I've irritated somebody. I like code. I like computers. I passed the code test. Give me a break.

Kip

If I had a Uniden 2510, I think I would want to enable the CB frequencies, but NOT in order to engage in outlaw CBing. Instead, my purpose would be...

(1) To LISTEN to Channel 19 in traffic jams and the like;

(2) To have one more place I could transmit in a real emergency.

But then I'm one in a zillion.

{you visit. What kills me is that I end up paying about twice that rate
{because the banks charge so much for the international bank draft!
{When I was in Oz the bank charged about $3, here in the US its more than $20!
{Does anyone know a better way to do it? Is it possible to do GIRO transfers

{from a US Bank? Is it cheaper?

You might try opening an account in a foreign bank, U.S. banks tend to try to "soak" you in any foreign currency transaction in my experience.
I used to have an account with Bank of Montreal (Canada) who would charge $1 (CDN) for a foreign currency transaction such as a money order. The nice thing is that the Canadian banks are almost all national banks so you can open an account ANYWHERE in Canada and many U.S. cities! B of M also does a lot of "bank by mail" too.

You DO have to declare the account on your income tax form and there are regulations for large amounts of money (>$3K or so), but so long as you aren't using the account for anything the government doesn't like there is no hassle.

Ok, the codeless license has been approved. We should hopefully be on the way to the new 'Golden Age' of Amateur radio. But we are still burdened with the wonderfully complex license structure (even moreso now, with perpetual CSCE's, etc.) dictated by some well-meaning folks in the early '60's.

I think the FCC could colapse the current 5 amateur license classes into 3, plus eliminate the need for perpetual CSCE's and two classes of 'grandfathered' technician class licensees by doing the following (preferably, before the new tech licensing takes effect):

1. Eliminate element 1B from General and Advanced class license requirements. Replace it with 1A, to conform to ITU regs.

2. Make all Technician class licenses issued between 4/1/87 (or whatever date Novice Enhancement took effect) and 2/15/91 non-renewable, with a 2 year licensing period.

3. Suspend the issuance of new General class licenses, making them likewise non-renewable, with a 5 year term.

Now for the explanation. (1) instantly upgrades 'Old' Techs to General since they would have passed 1A, 2, and 3 (now 3A and 3B), and are on an equal footing with generals. (2) phases out the remaining Techs that have passed 1A, 2, and 3A. They either have to take 3B and become Generals, or revert to no-code Techs or Novice. When the new Tech test comes on-line, it should be element 3 (i.e. combine 3A and 3B again). (3) phases out Generals over a 5 year term. Either they upgrade by taking 4A to advanced, or they revert back to no-code Tech or Novice. We would then have the following license structure:

Novice:	1A, 2
Tech	2, 3
Advanced	1A, 2, 3, 4A
Extra	1C, 2, 3, 4A, 4B

Actually, at this point the novice ticket becomes a bit redundant, so it could then be phased out, leaving us with:

Tech	2, 3
Advanced	1A, 2, 3, 4A
Extra	1C, 2, 3, 4A, 4B

Although Advanced should probably be renamed to reflect it's status as the primary HF amateur license. You will note that this scheme keeps Extra. This is *not* an error! The Extra has always been a 'wallhanger' in relation to the privleges you get for the effort you expend. I feel it should be preserved as a status symbol, if nothing else. With less paperwork, the FCC might even resume issuing the wall certificate type of Extra license.

The current Tech, General, and Advanced licenses have the most in common, and are the most likely candidates for 'telescoping' into one class. The upgrade route is simple, with most folks probably only opting to upgrade from no-code to the primary license. Them that want's Extra can go the route and get it, too.

What the hell's wrong with rah-rah? Do I detect a little
hyper-sensitivity here? I call it rah-rah because it was an emotional
appeal to pride of serving your country in time of war. That war
effort was worth supporting in the opinion of a vast majority of
Americans, myself included. And if you think that people today care
only about their own amusement, you should talk to some of the kids
over in HZ-land and their families.

So how about "Common Carrier Communication?" Did anyone on the net
ever do it?

I recently got on the air for the first time with a Yaesu FT-101B - what a thrill! But I'm having a slight problem with tuning up the transmitter for SSB operation. With the meter switch on ALC, the needle won't budge from the full-scale position, no matter how hard I yell into the microphone (while connected to a dummy load, of course :-)

I followed all the transmitter tune-up directions meticulously, paying special attention to the adjustment of the ALC pot under the hood. Setting this correctly was a bit tricky - usually I'd transmit to test, the needle would pin-out to the right, I'd back the pot off to get full-scale, and then try again. Then the needle would be below full scale. It took a while to get a feel for how to set it so it would come up to full scale correctly when transmitting started. The fact that the pot setting seemed _real_ touchy right around there didn't help matters - perhaps the potentiometer is worn out in this spot?

In any case, my first (and, thus far, only) QSO didn't evoke any complaints about my signal quality, so I don't really know if there's a problem with the ALC circuitry, or just with the meter. I have some understanding of electronics but not much practical experience. The schematics seem to indicate that the ALC circuitry is very simple.

Has anyone out there had any similar experiences with this xcver? Any suggestions on what might be wrong or what I should check? I've got a good multimeter and a lousy oscilloscope, but no other test equipment.

I think they're just breaking wind. The *next* excuse will be that
the theory is too hard.

After all, the gang that doesn't know an "omenmeter" from a "joltmeter,"
and are known to carry saltwater in jugs in their car trunks to
improve their signals, aren't going to pass the test. :-)

I have been thinking about all of the reports similar to this that I have heard, and it suddenly dawned on me that perhaps part of the opposition to no-code was the desire of some to keep ham radio down at the slow, lotech level they can keep up with.

Any thoughts on this?

>
> Also, EVERY single weekend, someone would go out with a spray can
> of black paint and opaque out the lens.  (not that I would suggest
> such a thing)...

Does anyone remember the days of the "Whammy"?  These were the two
"tubes" stretched across the road at measured intervals that measured the
time required for a car to trip the two wires.  Usually there was a cop
hidden in the trees just off the road who would take after the speeders.
Also, some jurisdictions took to placing plain rubber hoses across the road
```

as decoys. They accomplished the same thing: getting speeders to slow down for a few hundred yards.

In defining police radar, someone stated that it is a locating device. This is not correct. Police radar cannot tell you where the target is; neither can it tell you which direction it is moving. Only the operator can determine that; and the device can only measure speed.

Also, my definition of telemetry doesn't fit, because the device does not transmit the data it derives; it just displays it.

IMHO, it is important that none of these speed detecting devices solve the problem of speeders killing themselves or others a few miles down the road past the speed check points.

Just called the NTIS today (Monday, December 17, 1990 - there, that better? :-), and they said that the FCC had gotten the callsign database to them last Friday, they should have it out to me sometime this week (and, of course, I'm going to Colorado for a week, so I will not get the data until at least December 30, sorry about that folks!).

So, all you callsign project folks - sorry for taking so long to post anything, but at least its "real news" now.

Rusty (aka Mr Callsign Project, aka Rusty "I must be nuts to be doing this again" Carruth :-).

Here! Here!!

I see this as an opportunity for us to recruit many new people into the
Ham Radio Fraternity! I even got the XYL to say she would now study for
the Technician license! I have started working on a couple of co-workers.

I think we should put messages out to other news groups which we are personally
envolved with that could benefit by the changes. (i.e. back packers, bicyclists,
aviators, boating enthusiasts, video users, all the personal computer forums,
etc.)

Seems to me this is a little mis-directed. The ARRL did hear the requests of the membership in bringing up 90-55 to begin with.

The fact that they didn't succeed in staving off the actions of the FCC can be blamed on many things, but NOT the ARRL not listening, or trying to effect the FCC's decisions in a way consistant with what the membership desired. You certainly can gripe about how effective the league was in the above efforts, but they were in there pitching! If the league had sat on its haunches during the 220 business, the handicaped issue, or no-code then you'd be correct in your statement, but that doesn't describe what they did.

As an example, in the 220 effort the league didn't have to do much interpreting of what the members wanted to figure out that loosing the band wasn't a good idea for the hobby.   What they did do was 1) File comments with the FCC against the propossal, 2) File reply comments on UPS comments, etc. 3) Petition for reconsideration of the action once it was taken, 4) Lobby congress to change the FCC's ruling(which yielded a supporting resolution and a congressional hearing.) 5) Take the FCC to court over their ruling.   So they took the appropriate steps in something approaching the appropriate order. You can certainly pick holes in some of the efforts in this process(I know I can...) but to say they didn't try, and they didn't represent what their membership desires doesn't track from what I can see.

I don't know if the particular story be related is the one I'm familiar with but ....

Many moons ago down in the Santa Barbara area exactly this story did occur. I might get the players slightly mixed up since it has been at least 10 years....

Guy on his boat several miles out into the SB channel got in trouble
as the weather turned nasty.   For some reason he didn't use marine
channels(maybe didn't have them..) and did have a working CB(sorta).

He called several times on Channel 9 but to no avail.... and finally
reverted to keying the radio on/off sending morse code. Dave, W(A/B?)6RGJ,
while monitoring channel 9 copied the signal and figured out what the guy on
the boat was saying...HELP! Dave contacted the coast guard and got them
to dispatch a boat to help the boat in trouble. Guy was picked up off the
boat before it got swamped...

Brandon,

Your insisting that the statement "CW acts as a filter" be an absolute.
No-one ever claimed it was a perfect filter, just the best available(and
time tested...)

Now it's up to the OO's to clean up the mess that I expect to occur...
and there is only 650 of them in the entire country.

>HC901204.ZIP   HamComm: Transmit/receive RTTY with PC/XT/AT

Oh, I forgot.. To save trouble for anyone else who might download this program, the sample config file that comes with it has some strange defaults that you'll probably need to correct. HC.CFG tries to pick COM4 as the startup com port, and also disable COM1 from use. Since COM1 was the only port I had available, this had me stymied for a few minutes. Just pull HC.CFG into your favorite text editor, and comment out these lines with a leading "#":

```
  define port com4  iobase 0x3e8  irq 5
.
.
  define port com1  iobase 0  irq 0
.
.
  select port com4
```

Someone sent e-mail asking for the actual internet address for our NASA element set FTP site. My e-mail is bouncing to him, so I thought I'd post for the benefit of the net.

NASA element sets are available for anonymous FTP from:

```
     nachos.ssesco.com  [192.55.187.18]
```

in the directory:

sat_elements/nasa

Please use your e-mail address as the anonymous password so
that we can trace network problems.

Thank you.

Chris

Sure it has. That's why most of the ARF and BARF people have licenses
requiring 13 WPM or better, right?

My education in "good operating practice" and "friendliness and civility" came
from working rural 2m FM, and from working SSB DX (not pileups, but the real
thing), as well as ARES work. All voice.

>of the membership in bringing up 90-55 to begin with.

90-55 came up only after the FCC took away 220. Those "requests" have been
there since the 1970s and the original communicator proposal.

>The fact that they didn't succeed in staving off the actions of the FCC
>can be blamed on many things, but NOT the ARRL not listening, or trying
>to effect the FCC's decisions in a way consistant with what the membership
>desired.

They ignored the input from the technical community which would have directly
addressed the concerns of the commission. Instead, they used the same,
tired arguments, most of which are no longer valid.

I think the days of the ARRL as the preeminent organization of Amateur Radio
are numbered...

It really disturbs me that this thread has been titled "A New Problem"
This (sadly) seems to be the typical reaction by too many of the Hams

out there in radio land. I hear the words "Filter", "QRM", and this gem
>"A message to the more virulent no-coders out there:
>
>IF WE GIVE YOU ALL OF THE REST OF THE SPECTRUM FOR NOTHING...WILL YOU LEAVE US
>ALONE ON 30 METERS?"

Well, before I'm convinced it's time to sink the ship, let me warn al who are
Ready to the stop the any new enthusiasm of no-coders, to stay away from
Rensselaer Polytechnic Institute, in Troy, New York, becuase we have already
signed up 35 people for a quick one day session the morning/afternoon of
one of our Saturday Evening VE sessions. I mean, after Emag Engineering with
Professer Vlannes, and Circuit Synthesis with Prof. Close, these kids can figure
out a Yagi pretty darn quick.
Quote of the day:(from a EE junior)" are you sure there are no smith charts
OR transfer functions on this radio thing?"
And this is finals week! I can't wait for january.
The president of the electronics club said they may even eliminate their
VP-RF now that the code barrier has fallen, up at W2SZ.

>FIGHT LIKE HELL TO KEEP THE 30 METER BAND AND DIE IF NECESSARY TO KEEP IT CW
>ONLY.

This assumes that 30 meters is a CW only band. It is NOT!

There are only TWO band segments in ALL of the Amateur Radio spectrum that
are truly CW only:
        50.0 - 50.1 MHz

144.0 - 144.1 MHz

FCC rules 97.305 lists the 30 meter band to include RTTY and Data.
Of course 30 meters is a NO-PHONE band, and I don't see any reason
to change it.

>Thank you all in advance for your civility, friendliness and patience.....

No thanks.

I will make a counter offer. Help us make sure we get to keep the VHF and
above bands and we will help you make sure we get to keep the HF and below
bands.

I'm not saying the name is broken here...
It's just not as descriptive as it should be.
As part of the structure enhancement rec.radio.amateur.satellite might do
some good towards the end of distributing some of the traffic.

>> >Corollary: Even if it's broke, I like it that way.
>> This is a refuge for those without the initiative to make things better.

Huh? I've been licensed since 1976, and I have yet to make a single
CW contact on the air. Shocking, isn't it! Are you saying that I
haven't learned good operating practices? I've certainly not learned
good CW operating practices, but that certainly isn't a problem for
me.

How will CW help me learn good ATV operating practices?

How will CW help me learn good phone operating practices?

How will CW help me learn good OSCAR operating practices?

How will CW help me learn good repeater operating practices?

How will CW help me learn good packet operating practices? Will it
instruct me that P-persistant channel access algrithms on packet will

keep the channel from falling into congestive collapse? Will it teach
me how to implement effective networking protocols to allow a
frequencey to be fairly shared amongst a community of amateurs?

I suppose that I wanted to learn traditions of friendliness and
civility, I could visit a church.

CW may have help Amateurs learn the tradition of CW, but I fail to see
how it has helped the rest of us pursue our own interests in amateur
radio. If you enjoy CW, have at it; but don't tell me that I somehow
cannot be a "good" amateur without baptism by CW.

The Commercial General license is a piece of wallpaper only. Used to be you
needed a 2nd phone license to work on anything, and a first phone for broadcast
but that was changed to where you need nothing to work on anything. Almost.
The commercial telegraph licenses for shipboard are still being issued, as a
ship operator may have to operate near some backward (1) country that wants to
make sure radio operators and technicians are qualified even though the great
U.S.A. don't give a damn.   > >Also, is it legal to modify a CB to operate on 10

Since we hams can build our own stuff we can modify anything to do whatever we
want as long as we stay in our boundaries. CB and everything else is type
approved or type accepted, whatever.

Actually, the hell with 10 SSB with its incessant CB'isms. All I hear there
is "thats a big roger", "QSL this" "QSL that" " what's the personal" and
I never worked Pennsylvania before - send me a card and I'll send you one if
I ever get some printed.   Get busy on the key. CW is the way to go.

These people aren't on 2meters are they? I decided to moniter 14.313 for the
first time. As far as I'm concerned they all aught to be locked up.

I would be verry interested in efforts to get the FCC to do the job that we pay them to do, and enforce the laws. There is absolutely no excuse for the fedderal negligence in handleing this matter. It's gotten to the point where someone is going to get hurt, or killed, all because the FCC refuses to get off their lazy buts and end to this 14.313 problem.

(Sorry about the spelling, but I'm mad as hell right now.)

Paul Masters

The first wave of new Techs will be families of hams, and people who have been on the periphery of ham radio for some time (e.g., serious SWLs), and I expect these people to be very well behaved and to respect what's valuable in the traditions of ham radio.

The next wave will be serious electronics enthusiasts and the like.

I think that CBification will not happen, because people who just want to talk on the air will be rather put off by the theory exam. You have to remember that to someone with no electronics background, the Technician theory exam is not trivial.

And most of all, the process of studying for the theory exam will create a sense of commitment the same way that learning the code does.

Who is closer to the intended purpose of Amateur Radio...
the CW antiquarians or the VHF experimenters?

We all need to remember that the FCC doesn't give us spectrum to preserve
traditions. The FCC gives us spectrum (which it could easily have sold to
the commercial users, at *any* time in our history!) because of public
service, international goodwill, and ADVANCING THE RADIO ART.

]enhancers that are all the rage now. Would the next person to get nailed
]by one of those !#%$^! things try this as a defense and let us know how
]it worked (1/2 :-))?

The darn thing that lurks down the street from me in the pioneering
photo-cop town of Paradise Valley, Arizona is manned (or womanned).
I don't think it has anything to do with FCC regulations, but is more
related to past experiences in Texas where the removal of spent lead
projectiles and subsequent repair was a bit too expensive.

By the way - my 3 band radar detector DOES give enough warning to
take corrective action if one is on the ball (and, heaven forbid, if
one should exceed the 40 mile per hour speed limit on the 4 lane, divided,
no stoplights for a mile road segment).

I'm pleased, but not all that surprised. I had previously speculated
that Ralph Haller (who was a reasonable, if slightly devious, person
when I knew him) put out the original proposal as a straw-man.

I do wish that they would have a different call sequence for codeless
(or is the PC term "lesser abled"?) tech licenses - it would make
enforcement work a little bit easier.

Hey - folks. The Code-No-code debate is now moot. The FCC has ruled,
and is unlikely to be over-ruled. Who would think that the final
settling of the issue (In the US... I tend to forget that this is
the "skip" is in on Usenet) would result in a rekindling of the
Code vs. No-Code/Ears vs. DSP/simple receivers vs. simple xmtrs/...
issues? PLEEZE - It's a dead issue! Give it a break and take it to email!

PLEASE!!!

In terms of defining the "radiolocation" service, I do believe it is a braoder
```

definition of "location" that is involved, and does include parameters of the location or position such as velocity, angle of movement, and acceleration. Just because the actual location is not derived (and is not needed because it is obvious where the car is) does not mean it can't fit under radiolocation.

>IMHO, it is important that none of these speed detecting devices solve the
>problem of speeders killing themselves or others a few miles down the road
>past the speed check points.

I suppose there is a prevailing believe that somehow this will eventually convince the speeding drivers to change their ways. In reality it is more likely a means (intended or otherwise) to raise money for the police (and lower the tax drain on the taxpayers who are not speeders).

Hi

Any suggestions on where to bye a 3960 MHz microwave
head for the NASA Select TV ?

Is it possible to hear, see the NASA Select TV in sweden ??

What size on parabolic dish ??

Scientists discover planet-sized icky things, which misunderstand
us and are not radioactive, and can be killed by the Army, Navy, Air
Force, Marine Corps and/or Coast Guard. The End.

If you want to bring this feeder into the shack, take out one of the windows and replace it with a panel made from Plexiglass, Lexan(tm) or whatever you can get hold of; then drill two little holes for the feeder. You then keep the glass to put back in the frame when you move house......
Alternatively, cut a hole through the wall, and fit a suitable diameter piece of plastic pipe; this takes small-spaced feeder quite nicely. Remember to plug the space between the feeder and the pipe, or you may find rain, snow, small animals (e.g. snails!), freezing gales etc. coming through the hole.

I wish you were right...but the canonical comment of those who operate between 27.405 and 28 MHz is, "I'd get a ham license if it weren't for that #$%@#$^ code." Those people will rush to get no-code licenses. That's what frightens me about no-code, and _nobody_ has yet shown me that that fear is unfounded.

I personally think the FCC should allow automatic packet from 26.5 to 28.0 Mhz. It should give the computer hobbyist (both ham and non-ham) somewhere to run that USENET feed or FIDONET link. It should clear up the whole CB business in no time.
And no, there is no smiley after the above.

I have the feeling from reading the last several posting about this new "problem" that alot of people are missing a golden opportunity. Hopefully, the no code Tech class will bring new people into the hobby (I say hopefully, because Canada has had limited success) and it's important that we teach them how to be good hams. I teach a Tech/Gen class and have for the past three years. My students are very young (10 - 14), retired or close to my own age (32) which repersents a good cross section of the population. The point that I would like to make is that they've all become good hams (I don't what to sound like I'm taking all the credit because there are alot of other people that have helped them) because someone took the time to teach them how to become a good ham. Instead of predicting the downfall of ham radio why not help someone become a good ham.

Now to get off the soapbox. Is there anyone else out there that teaches a class? I would like to exchange ideals with you. I can be reached here or at skitch@nadc.navy.mil.

If you're in the Philadelphia area classes begin Jan 8.

Well, Santa came a bit early and brought a shiney, new
Panasonic KX-P1124 (24-pin LQ dot matrix) printer for my
new DOSbox. The question I have is this:
What is involved in and what does the 32K memory
upgrade consist of? Is it just rams and a jumper
or is more involved? I haven't opened the case
yet (I have to wait for when the wife is out
of the house for a while before doing that) to
see what is/isn't there.
Can any of you provide any information on this item?
Thanks in advance,

Ron Todd, K3FR

I wholeheartedly agree with this philosophy and hope that all the other hams and OFs out there will do all that's necessary to WELCOME these new hams and show them the ropes. This is the only way they will become familiar with CORRECT procedures so that they don't try to invent their own. Come on, all you people who wanted no-code. Now's your chance!
We're here to help you!

Why do people keep assuming there will be a sudden influx of lids? They're
already here! Just they don't get that much notice due to the relative
empty bandspace. All the influx will do is make us become more polite
and tollerent.

When I hear the higher class licenses on 20M, where's your arguement?
When I have a local extra who thinks it's funny to transmit on top of
me (I call it jamming, he thinks it's "funny"), where is your arguement?
When a local VE thinks pulling the PLL LOCK detect circuit out of his 2M
radio does no harm, and is only to keep him in band, where is your
arguement?

Give the new guys a chance, they are an unknown. The existing jerks are
already well established, but you ignore them.

I think we will see people conform to the norms of the hobby
the good the bad and the indifferent. The norms more than the
exams will put the pressure on to conform. Also remember that
once someone earns something they have a tendancy to value it.

Remember a license still must be obtained by taking a written
exam. The exam still must be studied for ..... there is some
pride in passing and as such .... I'll bet the fear of the
CB'er passes without many issues.

The other remarks made by the various posters are all relevant and
(sometimes) humorous.

There is a point no-one seems to mention, the concept of "filtering
out the noisy".

Unfortunately it is not one hundred percent successful but it does
make a lot of difference.

Anyone who has listened to the quality of the conversations on both
amature radio bands and the so called "citizen" radio bands have
noticed the difference in the mentalities involved.

As long as the difficulties of learning Morse code in order to
get a licence, continues to keep to a minimum the number of the
ignorant and foul mouthed types allowed to use certain frequencies
I have no doubt it will be used.

The days when in order to use radio communication one had to build
ones own transmitter (and hence be intelligent) have (some might say
unfortunately) passed, and the result of allowing the only barrier
to this form of communication to be money or theft can be heard
on any CB channel. (shudder)

So let us hope that "the powers that be" keep obstacles such as
the technical exam and the morse code test, for the benefit of those
who can use radio sensibly.

I do not have an amature radio licence, but I know people who do
and on the whole they are better than the CB types who dont.

John.

The FCC has never been big on policing the Ham bands, preferring instead, to
leave it to Hams to police themselves. This is IMHO in accord with the sacred
views that government exercise as little control as is absolutely necessary
over the activities of the people.

So, now comes Brian, who says that it doesn't matter which set of privileges
have been earned by the operator. What's your call sign and class of license,
Brian? Do you feel that there should be no class distinction? If so, why not
just say it. Form a protest to change the current system to a classless
system. At least, there'd be no need for self-policing the horrendous mess
that now exists.

Gee, I'm sorry that I caused all that pain and grief with just one question.
If you'll send me a copy of the USENET rules, I'll try my best to abide by
them.

I lived in an apartment building once many years ago and solved that problem by carefully removing a pane of glass from one window and replacing it with plexiglass. I drilled that to suit myself for feedline bushings, etc. When we moved out, we put the original pane of glass back.

They don't get tired, either. In time of disaster, which is better, a technolgy based on humans who can only put in a few hours of intense activity before becoming too tired to be reliable, or a technology that patiently grinds away by the hour?

In-reply-to: slp9m@cc.usu.edu's message of 17 Dec 90 13:24:31 GMT

I saw an ad for a tape recorder from sony that would record and later display the time and date of the recording. It was listed for about $100 and appeared to be about the size of a walkman, with a LCD display.

- Has anyone seen one?

- Does it use a seperate track for this info?

- Are the tapes compatible with normal players?

- Is it any good?

I am thinking of getting a new logging recorder and this souded interesting. I was also considering the "double-speed" recorder that compresses the info while keeping it understandable. This new Sony though, with the voice synthesizer on the R7000 would provide a lot of information.

I will summarize any email responses. Thanks, jv

There are two Morse code practice programs available via anonymous FTP from sumex.stanford.edu in the files /info-mac/apps/morse-code-*.hqx. They both send practice code for you to copy, similar to the code test (i.e., not real words). They both work on my Mac II (and probably on all Macs).

The Hypercard stacks are available via anonymous FTP from apple.com in the files /pub/ham-radio/*hamtestv*.sit.hqx. The stacks are really good, and will be my method of pre-testing myself on the written (when I get around to it). That directory also includes some Packet Radio applications for the Mac.

Cheers!

A radio used in CB service must be type accepted. Your ham radio (a) has not been type accepted, and (b) could not be type accepted for CB because it can transmit on other frequencies.

I would recommend taking a BB gun or pea shooter to the lens putting two
holes appropriately spaced, then stringing your ladder line through
there.  This will solve the problem of how to mount the feedline, and
will make a lot of motorists happy.  Be sure to put silicone around the
holes so as to keep the film from getting wet.

>731 is designed, that is, it requires one decoder for each band?

Yes you can set up different CTCSS frequencies for each memory or
VFO but only *one* can be active at any time and only one band can
have CTCSS decode active.

>2) In cross-band repeater mode using the radio as a simplex range
>extender, is it possible to require, say, the 440 side to use PL

Yes - this is the only way to work it.

>3) Our 440 repeater transmits a PL tone back only when there is audio being
>received through its input (i.e. it doesn't transmit a PL tone while
>IDing, while giving the hourly time report, etc.). Since this is the

>repeater's carrier to drop before transmitting on my HT? In other words,
>will it switch bands only after the carrier has dropped, or will it
>switch whenever the squelch is closed, in this case being once the
>repeater has quit transmitting PL?

SRI -don't know this one but I guess it would be OK as carrier without
tone does not cause x-band tx.

>4) Finally, with the PL decoder on (or off), will it pass the PL tone to
>the transmitting band with the PL encoder turned off (i.e. will it
>pass PL tones in repeater mode, or do they have to be regenerated)? This
>question is purely academic and probably has little relevence to anything.

No but you can select a tone to TX

The HyperCard Ham stacks are available from me, the author, to anyone
who wants to send me a 800K diskette and SASE.  There are also a number
of BBS's and FTP places which you might obtain them from.  Don't ask
me, I have no access to these, and I can't send them to you via email
either.  But if you can't find them anywhere else, USnail still works.

Does anyone know anything about this portable?

A few months ago, I saw a Sony multiband radio / tape recorder in a store window in Asuncion, Paraguay. It was a very compact unit and it gave me the impression that it would be an ideal travelers companion IF it performs as good as it looks. My family and I were in transit through Asuncion and hurrying to get a few things done downtown before heading out to the airport, so I didn't take the time to give the radio more than a passing glance. I didn't even go inside the shop that had it on display or scribble down the model number, which was WM 8000 MK II, to the best of my recollection.

Since then, I have kept my eyes open but have not seen the radio in any stores I have visited nor in any catalogs that I have in my collection. Does anyone know anything about this item? Does it perform? (Any reviews out there? Specs?) Is it a new model? A discontinued model? (Could be either for all I know.) Who distributes it? Is/was it marketed in the U.S.? What is/was the list/going price? Features?

I suspect that the FCC's recent creation of a code-free entry class license will be the cause of much debate in this newsgroup over the next few months (years?). In any case, the deed has been done and it's up to us experienced hams to welcome the new licensees into our hobby graciously. I was glad to see that the FCC granted all Tech privileges above 30 Mhz to the new class, thus allowing them to make use of the popular 2-meter band (in spite of the ARRL request that they only be allowed to use 220 and above). This seems to indicate that the FCC wants us to absorb the new licensees into the mainstream of VHF and UHF ham radio and to avoid treating them as "second rate" hams. Whether or not we agree with what the FCC has done, we should not "take it out" on these newcomers to our hobby.

WA2SRQ asked about "B" keyer timing, and what a character of the opposite kind was. I was sure someone else would answer, but nobody did, so here goes. "B" timing is just iambic mode. And a "character of the opposite kind" is a dit if you are sending a dah, and a dah if you are sending a dit.

Webster defines an "iamb" - from whence comes "iambic" - as a short syllable followed by one long syllable, or one unstressed syllable followed by one stressed syllable.

You have probably noticed that if you depress (squeeze) both paddles of an iambic keyer, it sends alternate dahs and dits. What you may not have noticed is that when you release the paddles, the keyer completes the character it was on when you released it, and THEN sends the opposite character. Thus, if you depress the dah paddle, immediately thereafter tap the dit paddle, and then immediately let go, you get a K (dah-dit-dah): the first dah because that is what you pressed first; the next dit because you had both paddles pressed (squeezed) - if only for an instant; and the final dah because you released the paddles while the dit was being formed, causing the completion of the dit and then "the opposite character" (the final dah). When sending things like the C or the period, you have to anticipate this by releasing one character early.

Uh oh. Here comes another big bad issue for everyone to kick around. I actually heard most of the participants on BOTH SIDES of the "Herbie" thing agree on something: on 2 meters, no one, and they meant NO ONE, was to talk to those "d#%$ no-code Technicians." I sense a huge war brewing here in which everyone will lose. Will repeater owners bar no-code Techs from using their repeaters? Will things degenerate into a "let's see who can QRM who to death" situation? Instead of the comradery that should be part of ham radio, I see lots of problems coming.

I hope my Tech license arrives before the new rules kick in; I'd just as soon have my Group C call from the start so that all of the old guys know that I'm a "real" Technician.

>then while it is doing so it IS a CB rig. What's the deal?

From an enforcement point of view, it's easier to police a few manufacturers
than millions of users. The FCC took the easy way out and required type
acceptance for the radios.

>Also, is it legal to modify a CB to operate on 10 meter ham? As a new

>synthesizer reference crystal to move the whole channel set up into 10m
>ham?

Yes indeed it is perfectly legal and practical to convert a CB set to
10 meters. Thousands have been converted. Generally, the synthesizer
crystal is not the one you want to change in a SSB CB. Usually there
is a fixed mixer oscillator that needs to be bumped up a couple Mhz.
Get a SAMS for your set and find out.

> Additional footnote. From (i forget) but probably a WWII vintage Radio Amateurs Handbook (they kept printing em...), there were articles on LF License Free ops and "wired wireless" (power line propagated LF.) I have no idea if these were actually used. I seem to recall that in certain areas (near military bases, ferinstance) even these were forbidden.

As it happens, I was over in the library last week and came across a 1944 handbook--it looked like it had never been cracked. There was a chapter about "Common Carrier Communications," i.e., coupling a signal (usually CW) into the power lines. The frequencies of choice were between 150 and 200kHz and "propagation" varied from 5 miles in the city to more than 10 in the country. The power limit was expressed as the amount of signal detectable from a certain distance from the power line. The construction example in the handbook was a 25W job. So it appears that they were definitely used--leave it to us hams!

The advertising section in the back had a lot of war-effort rah-rah, ususally depicting a pennant with an "E", referred to as the Army/Navy E. I assume that was a citation for contributing to the war effeort, right?

> Hello, I am looking for information on controlling the ICOM-751A transceiver via the interface plug on the rear of the unit. Icom sells the EX-309 interface, but I am unaware of any software for it. I hate to pay that much $$ for the interface if it is nothing but a level converter. If anyoune has any info on the Ex-309 or software control of the 751A, please E-mail or post. If there is any interest, I will sumarize to the net.

It is nothing but a level converter. Make your own for a lot cheaper. Also, the software is not very difficult. There has been stuff posted and other software is available. I have distributed a simple hack I wrote for the PC that loads memories from a file.

FOR SALE:

If anyone would like a cheap CIV interface complete with LEDs to blink and look cool I have about a dozen RS-232 "repeaters". These are a tiny black box with LEDs and two connectors (One DTE and one DCE) and a small wall-tumor power supply.

I will sell these and the wiring diagram (2 cuts and one add plus the mini-phone to the radio) for $15 each, including postage. Enclose a disk and I can pass on any source code for CIV control that I have.

My address is 107 Oak Ridge Drive, Ayer MA, 01432.

I suspect that most existing Amateurs, as well as the new no-code Technician amateurs would probably not want to talk to these bigots anyway. Come to think of it, I wouldn't either.

I suppose that they will QRM those of us that do choose to be civil and talk with the new amateurs? That will be might fine and civil of them, won't it? See how CW hazing has made sure that only "worthy" folks have had licenses?

Feh.

I for one hope that the infusion of new blood will turn the topic of QSOs from the latest round of medical problems and treatments to more interesting topics.

Forwarded from packet radio:

From   : KA5CDJ @ KA5KTH
Date   : 901215/2044
Subject : STS-35 SAREX Mission

We are attempting to compile all available data for use in studying antenna radiation patterns from the SAREX mission ... and are requesting you forward all packets copied from WA4SIR onboard the Space Shuttle Columbia. We will use this data along with vehicle attitude in determining the antenna radiation pattern. Please send ONLY packets received from your ground station. Packets MUST have been copied with time stamp active, and please include a short note giving your ground station location and what time zone your system clock was set to, i.e. UTC, EST, CST etc.

Forward to:

KA5CDJ@KA5KTH
     or
KA5CDJ.ampr.org (44.76.0.97)

Much Thanks........

73
Thomas "Brad"ford Smith
KA5CDJ

Packets can also be sent to gmorris@nasamail.nasa.gov or lescsse!gamorris.

Also because of nasty ITU regulations.

More reasonably, code is exceedingly useful in low-power operations.
Yes, DSP is going to change everyones life who can afford it, but
morse code still serves a serious need for efficient communication
with exceedingly small bandwidths (important on shrinking ham bands).
If you have ever tried to work a satellite on battery power (like I did
last field day), you'd see that morse is about the only reasonable way
of pulling it off.

Of course, I really haven't used code since then...

>code are perfectly free to continue using it. (this even includes me from
>time to time) Your overreaction to Henry's gentle ribbing reminds me of
>Shakespear's line "methinks thou dost protest too much."

-excuse me????

I'm not comming down hard on henry because of his preference for phone over cw. I'm comming down on him for the rude, irrational, inconsiderate, answer he gave Shailendra. Shailendra asked a question,"Say, why do people use morse nowadays anyway?" I assume this to be the genuine curiosity of a new ham. If this is the case receiving the answer Henry posted would be not the least bit helpful.
(henrys response)
--For conformance with antiquated regualations, because they're old-fashioned.
--or because they're stranded on a desert island which is well-supplied with
--analog electronic parts but has no digital parts. Morse is basically
--obsolete, since digital modulation techniques are far superior at punching
--clean signals through noise.
This is not how a ham elmers another ham. This is mixing politics and "religion" with lending a helping hand. Personal beliefs are no reason to waiver courtesy.

The no-code battle is not over. There are those who want to eliminate the present "novice, tech, general, adv, extra" class structure. While i believe, and have always stated that the phone bands should be open to all hams who want to use phone I dont want to see the cw bands eliminated or restructured. Further i stated that this is not to have 'exclusive' bandspace but to simply have a place where i can run high speed cw. I am not a high speed wizzard but can keep up pretty well. I would like to get better, the only way to do that is by working others with similar goals. they are found in the "low" end of the band.

Again I would never take an anti-phone position, yet pro-phone people are very comfortable taking an anti-cw position. This breaks up the ham radio community into two groups. If we are already divided it will be easy for anyone to break us up further. I am promoting "fraternity and sorority" these are good things. I don't think your comment "lighten up" is appropriate. Nor is your Shakespearian referance, the context is wrong.

>To paraphrase my reply comments on 90-55, how come you guys only mention
>the simplicity of the cw *transmitter*? It seems to me that a workable cw
>*receiver* is quite a bit more complex than the simplest AM receiver, the
>crystal set.

My dear phil lend me your ear and i will enlighten you. You can recieve CW with a crystal set (shhhh don't tell anyone it's my secret and yes I have done it).

>>"Morse is basically obsolete, since digital modulation techniques are far
>>superior at punching clean signals through noise: Sorry, here you are simply
>>wrong. I suppose you could argue speed but not punching through. I have

>>a nand gate for the final (i think it was something like .1mW output). No
>>insult intended.

>This argument is also answered in detail in my reply filing, and Bill, *you*
>are simply wrong. Rather than repeat the entire thing here, I refer you

>to it. Suffice to say that CW, as it is generally used in amateur radio
>(on-off keying of a carrier) is *extraordinarily* inefficient in terms of
>both bandwidth and power. Many more computer-oriented digital transmission
>techniques exist that are far more efficient than manual CW, and some of
>them are even in use by amateurs. (this is not to say that these techniques
>don't also have a lot of room for improvement - they do.)

YIPE YIKES first off only my grandmother calls me bill. You can see I sign
my name Buzz (FYI :-))

Phil, I don't claim to know everything (although some people think I do :-))
If you can show me a digital mode that operates at roughly the same speed
as 20wpm cw and uses less than 200hz (not Mhz or Khz but just hz) of bandwidth
(this is the bandwidth of a cw signal) and can work all states on .1mW (1/10000
watt) then i will believe you. I'm not a religious nut over cw if you have
information please let me know. I don't have your previous posting possibly
you could send it to me. Oh yea digital is cool but really cool digital
stuff costs $$$$$$$$$$!!

In closing Phil I hope you realize that I'm bananas or fanatical about code.
-i support full phone privs for everyone
-i like the no-code licence (i don't like HOW they did it)
-i believe cw is fun, cheap, efficient and effective

if you can show me otherwise great! I will have learned something and possibly
expand my hobby. otherwise . . . in the words of Calvin Hobbs after seeing
all sides "your still wrong!"

Well folks we have a new class of Hams comming on board. The FCC has
changed the rules and if you agree or not here they come. Now it is up to us!

It is our job to find the people that will help the hobby grow in a way that we can live with. Here is the people that we need to find to help the hobby!

- Technical gurus that will add new technology to the hobby.
- Get Kids involved so they can experiment with radio and computers

(kids already love the computer and love the Radio Shack walkie-talkies!)

- How about a friend or maybe your wife who are interested in public service?
- Are there others? Let us find them!

I told my wife about the new license and she is ready to go! I am sure she will be ready to take the test in February. I have already told her I will buy a new COMPACT HT for her to carry in her purse! She is going to be ready for the next Earthquake!

I told some friends at the company Christmas party about the new license and they all said that they were ready! These were all very tallented engineers that will contribute in networks and digiatal control!

It is all up to us! So go out there and get the new hams ready!

It is important to remember that all of these new people will be getting involved at the same time. We will need to make sure they ALL learn good habits and not the bad ones. Take the time to help the new ham to be sure that they have everything they need to have fun and to be part of the entire HAM population!

I expect that I will have study meeting to help study for the new exams at my company! Are you ready for the 90's!

DE KJ6NN

Actually, the rules for working on CB were relaxed a while back.

BUT, CB's MUST be type accepted, and type acceptance REQUIRES that the CB have 40 discrete channels, and no more, and that these channels are NUMERICAL, not frequecy oriented. In pre-40 channel days, where there were licenses for some special allocations that are no channels 24 and 25, they could only LEGALLY be installed in a CB if a CB channel was removed on a one-one basis.

COnverting a CB to HAM is 100% legal, if you do it right, but that also means the unit is NOT to be put back into CB service. I have a unit that goes 100 channels wide, and was used for the first block in a 2m SSB transverter setup. The radio is 100% legal as HAM, but only as HAM equipment. If I ever disconnect the transverter and transmit on CB, even without going 'out-of-band' the radio is illegal, at least as far as I read the law.

>charging current to the battery.

This is probably not all that good an idea if you use the rig a lot on external DC. A simple charging system like this has no provision for ending the charge if the battery starts to overcharge, and it's voltage depression due to overcharging that really causes the NiCd problem that most think is "memory." (NiCd cells really don't have a true "memory" problem, at least not one which will normally be seen in the vast majority of applications. Details and references available on request.)

Tried mailing and it bounced... Unless your TS520S has the DC power module, a 12V power cord won't do you much good. (Actually, I'd like to get a schematic of the power module, which I gather is mainly a couple of power transistors that switch current in the built-in power transformer...) And you can use 'most any 50k ohm mic; for a while I was using a Radio Shack electret mic that took a AAA cell for power. Radio Shack also sells (or at least used to) 4-pin mic connectors that work in the TS-520S.

Re Why CW??

After perusing a brief article in QST about how few hams there are in India (VU2xxx) ......

All the talk about how "cheap" and "available" digital techniques may be true in some parts of the world but it certainly isn't true worldwide. It sort of reminds me of how coworkers disparage 68000-based workstations as being antiques while some countries are still putting import restrictions on hand-helds......

Feel free to use digital, but don't forget it's a great big world out there. Perhaps one should have more respect for the poor third world ham who uses a sawblade hand key and string-and-gum-wrapper transmitter to give you a DXCC card.   Then again, maybe there aren't many of those either......

Actually, there will be three Technician classes.
1. Took the General written exam and 5 WPM (the oldest)
2. Took the current Technician written exam and 5WPM (past couple years)
3. Takes the new Technician written exam and no CW (starting in about 60 days)

> I also understand that there will be no call-sign differentiation. So how will we bge able to tell if a Tech who is operating below 30 MHz is authorized to do so?

Don't worry, I am sure there are lots of op's out there are already warming
up their rigs to "police" things.   Maybe 14.313 is just the beginning.

I downloaded this late last week and whipped up the little comparator
circuit, not expecting much. Wow! What an amazing program!
One of the first things I copied was the W1AW bulletin announcing the
no-code license. Then spent the rest of the weekend poking around on
20 meters "printing" DX (JA, PY, VE8, VK, etc).
I haven't messed with RTTY since my college days of
a PLL decoder and an old model 19. This certainly compares favorably
with that experience. The spectrum display is amazing too... How is
it done? Certainly my PC can't do an FFT with that many spectral lines, that
quickly...

Many thanks for the most valuable and interesting piece of freeware
I've seen in a long time...

(Shailendra Anant Save) writes:
> Say, why do people use morse nowadays anyway?

For conformance with antiquated regulations, because they're old-fashioned,

or because they're stranded on a desert island which is well-supplied with analog electronic parts but has no digital parts. Morse is basically obsolete, since digital modulation techniques are far superior at punching clean signals through noise.
--
"The average pointer, statistically, |Henry Spencer at U of Toronto Zoology
points somewhere in X." -Hugh Redelmeier| henry@zoo.toronto.edu   utzoo!henry
----

Morse IS a digital modulation technique! While it's far from the best, it's one of the easiest and cheapest to implement. It's good enough that in weak signal conditions it beats the current voice systems.

We do what we do because it's: a) fun to us. and b) sometimes useful.

Let me rephase your last sentence:

Amateur Radio is basically obsolete, since telephone company techniques are far superior at punching clean signals through noise.

Bill - WA7NWP "20 meters would be a great digital-only band."

Conformance with regs has nothing to do with it. Nobody will force you
to go anywhere near a key after you get your license. Besides, some of
us *like* CW.

You know, if I changed the above question to:

> Say, why do people use 16 bit architectures nowadays anyway?

your answer would still apply. Come on, Henry - you've only had a
"no code" computer for a year or so :-)

It is incumbent on all of us to welcome the new no-code Technicians into
the mainstream of ham radio.

The FCC gave them 2-meter privileges (after having proposed not to do so)
precisely because of this -- they want the new Techs to be REAL hams, not
exiled into some UHF ghetto.

If the present hams ostracize the new Techs, the present hams will look
very bad in the eyes of the FCC. Remember, the FCC doesn't give us spectrum
to preserve the radio traditions of 1920. They give us spectrum in order
to serve the public, enhance international goodwill, advance the radio art...

So here's my message to all the new Techs: WELCOME!

I don't know which programs are on sumex, but if they're the same two
as are on apple.com, they *do* accept "real words". You can create an
ASCII text file and have the code program play it for you. This allows
you to drill yourself on certain words (such as "antenna", "QTH", or
whatever.) Or if you like, you can have someone else write the file
so you don't know what's in it.

The two we have are Morse Trainer from N6MZV and Morse Tutor from WA4FIB.
They're in the directory pub/ham-radio.

73,
Patty

Actually, if it is possible for anyone to gather the statistics from the various VEC's, I think a lot of people would be interested in seeing those statistics published every month for the next couple months. Just to see if this new class really has any effect on the number of people going for their ham license. I know of 2 people right of the bat that have started looking for a test site since hearing that the CW is not necessary any more. Both are interested in packet and not talking on the local repeater. And for the sake of those collecting demographics, one is male and one is female. :-)

Right. As long as the user has a ham license!
